OWING to absence from home Mr. Scott was unable to contribute his usual batch of seasonable hints for this issue.

LEBANON, PA.—R. W. Wynings has succeeded the firm of Wynings & Dace, remodeling their establishment and adding five new houses.

TRENTON, N. J.—Umpleby & Son have added three new houses 150x18 and have opened a store opposite the postoffice. The cut flower trade has been very good here so far this season.

MT. HOLLY, N. J.—Chas. B. Hornor, proprietor of the Evergreen Avenue Nurseries, has lately admitted to his business his son, Harold Hornor, and the firm will be known in future as Chas. B. Hornor & Son.

LEXINGTON, KY.—Mrs. D. Honaker is building a new range of houses containing 10,000 feet of glass. This added to the 12,000 feet erected last season gives a total of 22,000 feet of glass in this establishment.

Greenhouse Construction.

Mr. W. A. Burnham of the Lord & Burnham Co. delivered a lecture before the Massachusetts Horticultural Society on Saturday, Feb. 10, his subject being "Greenhouse construction." He said that greenhouse building as a business of any dimensions of interest in this country dates back only to the close of the civil war. During this time the evolution in greenhouse architecture and construction had been remarkable, and probably in no branch of building in this country has greater progress been made. He estimated that the total amount of money invested in glass houses, including both commercial and private establishments, is no less than $285,000,000. The progress which had been made in greenhouse building had been chiefly along the following lines: 1st—more artistic designs and adaptation to location; 2nd—better arrangement of plans for light, ventilation and heating; 3d—greater economy in construction and durability; 4th—general adaptation to the growth and exhibition of plants.

In speaking of the selection of plans Mr. Burnham said that this is a matter of first importance which should in all cases be placed in the hands of some person of skill and experience in this special branch of architecture, as an ordinary architect, having little or no experience in such work, could not be expected to properly provide for well proportioned ventilation, proper arrangements for sunlight, pitch of glass and other essential conditions in greenhouse construction. For roses, midwinter flowering, forcing and early vineries he recommended what is known as the three-quarter span, having the ridge about east and west, with the long slope to the south; for most other purposes the full span houses with the ridge running north and south was approved. Referring to the much discussed short span to the south system the lecturer spoke as follows:

It is a modification of the three-quarter span house, having the short slope of roof on the southerly side. The height of the sides are alike. The pitch of the northerly side is from 22½° to 30°, and on the southerly side about 45°. The plant tables are all on a level. It is claimed for this style of house that in the dark winter months the sun's rays strike the glass at nearly right angles, and that in consequence more of the rays enter the house than through an ordinary pitch roof, and better results are thereby obtained; also that the low pitch on the north side allows the houses to be set up against each other similar to the ridge and furrow system. The claim that a greater number of effective rays of light enter the house through a longer plane of glass at a less pitch is doubtful. A long flat glass roof on the north side where the sun never shines, to hold snow and ice until the warmth of the house melts it off, is certainly a disadvantage which can readily be appreciated in this latitude. Undoubtedly this style of roof admits a large amount of light, but in this respect it has no advantage over a full span roof running east and west. Architecturally it presents a very awkward appearance. The level table plan keeps all the plants except the front bench more or less in the shade of each other, which is largely avoided in the arrangement of elevated tables such as are usually adopted in regular three-quarter span houses.

He treated the construction of greenhouses under three general heads.

1st—Sash bar houses: These differ, he said, from other houses in the bars being made of greater dimensions and strength, constituting the principal framework of the structure. The cheapest, though not the best, mode consists of this old fashioned post and sash bar house furnished with an entirely new set of details. As formerly constructed it was so frail that it would last in good condition not much more than five years. Some houses of this class have been rebuilt three times in twenty years and are now in a very shaky condition. If they had been constructed in accordance with the new details and with the materials now in use they would easily have lasted without rebuilding until the present time. The construction is entirely of wood except the purlin and ridge supports, which are usually gas pipe posts. A list of the different members and a description of same which go to make a complete section of the house are as follows: Ridge in three sections so that the splices are mismatched, with side grooves for ventilators and glass, projections for support of lower edge sash bars, and a dripped cap. The ventilators are of the usual style, but fastened together with light metal caps, so that, although made in sections, they are practically the same as a continuous single sash the length of each ventilating shaft. The gutter is formed in three sections like the ridge so that all joints are mismatched. The joints are butted in lead, with metal slip tongues. The side posts are of locust, cedar or cypress and not less than six inches in diameter. For a slight additional cost iron posts can be substituted. The sides are of double boarding with two thicknesses of strong building paper between. The sash bars are of cypress 1⅛x2¼ inches, rabbeted for the glass and dripped to carry away leakage and condensation. They are usually placed for 16-inch glass and run through without framing from plate to ridge. Stationary glass or sash ventilators can be substituted for the boarding above the side tables if desired. At the foot of the top ventilator a header is fitted over the bars without cutting them, receiving the glass, and in a simple and effective manner do-

ing away with all framing at that point. Where a small original investment is an important factor there is no construction superior to it. It is especially adapted for florists and market gardeners commencing business on a small or borrowed capital, where it is important to secure the largest possible income for the least present investment.

2nd—Wood frame greenhouses: The second style as to desirability and cost consists of an improved construction, wood forming the principal part of the frame. The sills are made in three sections to cap a brick wall, and are adjustable to its inequalities. The splices being made at different points in the length the sill is the same as though of but one piece its entire length. The members of the sill are carefully pitched to turn off water. The rafters are in two pieces, the long roof piece running from ridge to plate, and the upright between sill and plate. These are joined at the plate or angle by means of a cast iron bracket securely bolted; a similar bracket is used at the ridge. The sash bars are 1¾x⅞ inches dripped to collect condensation. The purlins which support the light sash bars are of angle iron fastened by iron lugs and bolted to each other through the wood rafters. There is no place left in this construction where the wood used is not protected in the most thorough manner against decay. The house is very light and at the same time strong and durable. This construction is only adapted for straight roofs. The form of the house is simple, but very neat and graceful. Perhaps a larger number of this style of house have been built than any other, and as they present equally as good an appearance as a more expensive construction they are likely to remain a popular style of house.

3d—Iron frame greenhouses: We come now to the third class, and by far the most important, as it embraces the best forms of construction throughout. It consists of wrought iron frame, cast iron sills, wrought iron benches with slate or brick bottoms; in fact every part of the house which bears any strain or which if decayed would injure any other part is of iron and comparatively indestructable. Wood is used as a cap for the iron work to prevent trouble caused by contraction and expansion, and as a setting for the glass.

The first range of glass where this construction was used was erected in 1881 for the late Jay Gould. At a recent interview Mr. Mangold, Mr. Gould's superintendent, stated that so far as he knew not a light of glass had been broken by any settlement or by expansion or contraction during the twelve years since it was built, and with the exception of painting there has not been a dollar's worth of repairs in that time. Before the erection of this house and the adoption of this mode of construction the nearest approach to it was in the conservatory at the Botanic Garden at the Capitol in Washington. That house was originally built entirely of iron, the glass being set directly on the iron rabbets. In this form it was not a success, and after repeated repairs and modifications wood rabbets for the glass were substituted, and in this modified form it has since been fairly successful. The experience of Superintendent Smith with this house and his valuable suggestions led the way to a decided and important improvement. During the winter of 1880-1881 Mr. Gould's extensive range of glass and collection of plants were entirely destroyed by fire, caused by a defective flue. The old houses were of wood construction and Mr. Gould requested that if possible the new ones should be of iron. Up to that date there were no greenhouse builders in this country using iron for construction, so that to meet Mr. Gould's desire it became necessary to plan a new departure in the method of construction. With the experience of the Botanic Gardea in mind the new details were perfected and successfully embraced in rebuilding Mr. Gould's houses, and were almost immediately adopted by the late Peter Henderson in an extensive range for commercial purposes. With such endorsements the new method of construction soon became popular, and most of the important glass buildings erected since that time have been built on substantially the same plans. The winter garden and greenhouse of Mr. Wm. B. Forbes, at Milton, was one of the earliest examples of this style of construction in the vicinity of Boston. The system admits of any form of roof which may be desired, from a plain and simple lean-to to large full span curvilinear structure with Gothic or Ogee curves. In curvilinear work it has entirely superseded the former wood construction.

The iron sill is cast in sections of the same length as the distance from center to center of rafters, usually six to eight feet long, and shaped to cap an eight or twelve inch wall, according to the size of the building. A lug is attached by a tap bolt to the end of each sill; the rafter is placed so it rests partly on the end of each sill, and when a single bolt is placed through both lugs it will be seen that the two pieces of sill and rafter are all substantially secured. The expansion of the sills is allowed for in a very simple manner by drilling the holes in the lugs slightly larger than the tap bolts. The form of the sill is such that great strength is obtained with the use of but a few pounds of metal per foot. The top of the sill is beveled so it does not hold water, and is provided with a stop cast on solid for the ventilator or sash to close against.

The wrought iron rafter is formed of refined bar iron, ½x3 inches dimension for small houses, twenty feet and less in width, to ¾x6 inches for houses having a fifty foot span. This iron can be had in any lengths desired and can be bent to the shape of the roof, cold, by means of a screw or hydraulic press. No matter what the shape of the roof this supporting rafter can be bent or welded to it, giving equal strength as though it were a simple straight line house. Purlins are placed laterally between the rafters about four feet apart. These are made of wrought iron bars or angles and serve to brace the rafters sidewise, also for the support of the light sash bars and glass. In joining the purlins to the rafters care must be taken to allow for the expansion of the metal and some special provison made for it, as when the sun shines directly upon the iron it has been known to expand nearly ⅛-inch in an ordinary length of purlin. Such an expansion in each purlin in a house one hundred feet long would amount to a total increase in the length of from one to two inches, and would cause certain destruction to the glazing and other parts of the structure. In this connection the experience of one of the proprietors of an important New England iron works may be of interest. He stated that his father, who was an expert engineer and had established the works many years before, had built himself an iron framed greenhouse. The first season it was ruined by contraction and expansion of the metal. With this experience as a guide he attempted to remedy the trouble and made extensive changes to cure the defects, when it was again badly damaged. This time he gave it up and rebuilt it with wood, saying that an iron frame was not adapted for greenhouse purposes. This old wooden greenhouse, after standing many years, was replaced by one of the modern iron constructions with entirely satisfactory results. The amount of wood used in this construction for sash bars, caps, sashes, doors, etc., is very slight, and as no weight or strain of the building depends on any piece of it and as each piece is itself supported by the iron frame, a very long time must elapse before any repairs are needed; but when that time comes any part of it or all can be readily renewed.

Regarding ventilation the lecturer said that there seems to be but little difference as to whether the ventilators are opened from the bottom or the top of the sash as far as protection from the winds when in use is concerned, but there is a decided difference in the mechanical construction in favor of having them hung to the ridge. He favored the use of side sash ventilators for rose houses and others which are to be run in the summer months. He spoke highly of American glass, the manufacture of which has now reached a high state of perfection, the double thick glass averaging nearly ten per cent. thicker and stronger than the French glass, which in a hail storm may easily mean the difference between a broken roof or one that stood the storm. As to glazing he favored decidedly wooden sash bars, and cautioned against the use of adulterated putty. For painting he said there is nothing better than pure white lead and raw linseed oil, two to three coats to new work with an additional coat after one year, and repainting every two years, as a roof that is regularly and properly cared for will last twice as long as one which is neglected for several years and only repaired when it must be.

The construction of plant beds, the selection of lumber, foundations, walks, location, heating, potting rooms and other pertinent subjects were all treated at length and after the conclusion of the lecture the audience remained a long time asking questions and discussing the various points brought out. Hot water for heating establishments under 10,000 feet in extent was advocated while steam was acknowledged to have many advantages in its favor where large establishments are heated. Over head heating was positively condemned by the lecturer and seemed to have no advocates in the audience.

Benches First, Roof Last.

Plant houses are usually erected and glazed before the heating pipes and benches are placed; but we built a house last season in which we reversed this order, much to the satisfaction and comfort of those who did the work.

As soon as the walls were made we put the heating pipes in position with their permanent supports, then made the benches and laid the walks, having the latter to travel on during construction and the benches as substantial level platforms to scaffold from.

I send with this a photograph showing the appearance of the building while the roof was being added. W. T. BELL.

Franklin, Pa.

PLEASE mention the AMERICAN FLORIST every time you write to an advertiser.

BENCHES FIRST. ROOF LAST.

Our Telephone.

Hello! Hello, Newport! Is that Newport, R. I.?

Yes. Number, please.

Tie us up to Carl Jurgens. Hello, Mr. Jurgens! Is that you?

Yes. Oh, how do you do? What can I do for you?

Tell us something about bulbous stock. How is it going this winter?

Well, slow, except lily of the valley. I think the people don't care very much for bulbs now. Roses and carnations are what they want. When roses are cheap there is no show for bulbs. If roses would be as dear as eight or ten years ago, bulbs would sell.

Do you think that the cheapness of roses accounts for the decline in the demand for bulbous flowers?

Yes, I am sure it does to a considerable extent. When roses were scarce bulbs sold. About middle of March so soon as roses got cheap I always noticed that bulbs had to suffer. From about 1884 more roses were grown and since then the bulb flower trade has been falling off every year. Bulbs will go just as camellias did. The people have got something they like better.

You say that lily of the valley sells well still?

Oh, lily of the valley will always sell. Everybody likes it because it is sweet, and it never will be out of the market. I remember in 1869 when I told a well known florist that I thought I would grow lily of the valley in quantity for the market he said it wouldn't go. "But what are you going to do with it," he said, "it sticks up; it never can be used." At that time you know they made up all their flowers into flat solid bouquets.

Are you growing the same quantity this year as usual?

No; good valley stock was scarce last fall and I did not lay in so much. Up to December 1 I use stored pips. I put in no new ones till December 1. The last flowers from the old are gone by January 1, but the old foliage we keep to go with the early flowers. By middle of January the new foliage comes good.

How about tulips?

Tulips, there is nothing in them any more. A few fancy ones will always sell, as some people like them, but in quantity tulip forcing is gone. Pink tulips are the best selling now, but they must have good flowers and long stems, so they will have to be late. Tulips forced early have no shape to them. Duc Van Thol you can't give away, not even in the streets. There are so many roses and carnations there is no room for tulips.

The demand for tulips increased very rapidly at one time, did it not?

Yes. In 1872 I had 2,000 tulips in and couldn't sell them. The next year I had 20,000, but only white would sell. I increased every year till at last I forced 280,000 in one season. Last year it had got down to 80,000. It's queer the way they used to want them. In 1881 or 1882 I forced 95,000 Duc Van Thols up to January 15 and they all went. The New York people couldn't get enough of them. They would not give them time to open. Just the red point between the folded leaves. Klunder, he would just pull off the two leaves from the little bud. "You see, it's as good as a Bon Silene," he would say. But ever since 1884 the tulip has been running down. After that we had to have finer varieties too. Even at Easter tulips are gone up excepting in pans as plants. Many bulbs will always be sold this way. I believe that bedding out will increase, so the tulips will always find a market, if not in one way in another.

How about narcissus and Roman hyacinths?

Well, the paper white nobody seems to want. There are too many of them by half, if anybody is to make any money out of them. I find the double Von Sion the best selling. The single one is harder to sell. I get one cent more always for double ones, but there are fewer of both sold than formerly. We all got a black eye on double narcissus last year. There was a big demand and the price was put away up. Oh, they're very keen, the Hollanders. For my own taste there is nothing handsomer than a big single trumpet. Over in England they are highly prized and they are getting out handsome new varieties all the time. The poet's narcissus I used to sell lots of, but the carnations hurt that now; they take its place. Roman hyacinths have been selling very low, although they were grown this year in reduced quantities.

Do you force lilacs?

I believe I grew the first lilacs that were ever seen in America before Christmas. that was in '71. You can have it easily by December 15 with plenty of heat and good root stock. Boston never took to lilacs. In New York they were popular, but I think they are gone there too. Every flower seems to have its day. A few years ago here in Newport they all wanted sunflowers and such things, but it only run for about one season. Anything sweet, roses, carnations, violets and lily of the valley always will be popular. So I am going more into roses. Perle is a good rose here; it comes a fine deep color with us. I have three houses 200x23 and one house 120x18 of Perles. The buds all go to Boston.

Do you get many "bull heads" on your Perles?

Not many. I believe that trouble comes from the plants getting a chill. As soon as cold weather strikes in December we get them, but none from now on. I never see them in the spring or fall. In summer I rely on La France. That is the rose for Newport, but it's no good for Boston. Meteor mildews badly with us in summer.

Carnation Notes.

"It's good, but it bursts badly" is a common expression among carnation growers, but hardly a correct one. No carnation that bursts badly can be called a good one. If it is not a good one, what is the use monkeying with it? Fire it out of your list for next season and replace with a better one. This bursting business is a funny thing to control; sometimes you think you have found the proper way to handle them so they will not burst, and the next season away they go all to pieces again, as if their main object and purpose was to mortify the grower and teach him how little he really knows.

In conversation with a grower recently I was told that he had a very fine seedling that did not burst the calyx last season and this season it is almost worthless from that cause. He acknowledged that he had been using an artificial fertilizer on it and stimulating it considerably, and thought that might be the cause. My experience has been that any extra stimulation beyond what will produce an ordinary healthy growth will also produce bursted calyces. Keeping the houses very warm and at the same time very moist will have the same effect. I find that carnations grown on benches are more subject to it than those grown in solid beds; that growing them very cool will bring more bursted flowers than all the other causes combined; that varieties that are not generally subject to bursting will in a spell of very dull weather start and if not very carefully watched will make a bad lot of bursted flowers.

We can learn a little from these causes how to help ourselves. In the first place it is well not to have your soil too rich. If you find that they will bear a little more stimulation after growing a while you can add what you think from their general appearance they will be able to stand. It is not policy to grow them too poor, as even that will cause them to burst, and you want to give them just as much manure of whatever kind you use as they can stand to get the best results. Keeping the houses very warm and at the same time very moist, also keeping the houses very cool, will burst the flowers. Everyone will have to learn for himself what temperature his plants will do best in, as a difference in the soil will also make a difference in the temperature best for them; and the different varieties will almost all do better in different temperatures. Wherever it is practical each variety should be in a separate house so it can have special treatment.

I am still astraddle the fence on the question of benches versus solid beds and don't know which side to get down on. When it comes to a variety like Fred Dorner and Aurora there is no question but what the benches are the best, but when you get into Lizzie McGowan, Daybreak and a number of others there seem to be more points in favor of the solid beds than for the benches, not the least of which is the fact that the flowers will burst a little more on the benches; in fact with those two varieties there are scarcely any bursted ones on the solid beds, while there are a few on the benches. The main object is to try and get varieties that will not under ordinary conditions do any bursting, then keep an eye on them all the time for any indications and hunt up the cause and remedy it.

ALBERT M. HERR.

Chicago Carnation Notes.

NILES CENTER.

Carnations at Stielow's are in full crop and with exception of one or two benches are looking well. Daybreak particularly is extra fine. The house of this variety is without exception the finest we have seen this season. There is not a poor or diseased plant in the batch, the growth is wonderfully robust, and as the plants are neatly staked and tied the house is a beautiful sight. Mr. S. is naturally more than pleased with this sort, and in his opinion it will produce as many blooms as the more common kinds. But the majority of the other growers we interviewed on this subject do not claim quite so large a yield, still all are agreed that as finely grown blooms of this sort always find a ready market at figures from 20 to 30% higher than common varieties it proves one of the most profitable carnations grown.

In an adjoining house we find a lot of Garfields. The plants look vigorous and are covered with buds and fine blooms. This stock is grown in solid beds, the soil in which has never been changed since first planted with this variety, which has been grown in it for five or six consecutive years with the most satisfactory results. We acknowledge that we have seldom met with a superior looking lot of Garfield, but although this manner of growing it has been very satisfactory here it is still an open question whether it would not have succeeded even better if the soil had been changed every year.

Lizzie McGowan and Silver Spray are grown for white. The former is looking well, and barring here and there a diseased plant the stock looks healthy. As a producer, too, this kind is quite satisfactory, and as seen at this place is apparently free from rust. Silver Spray, too, is in good form, although not entirely free from rust. The blooms have a tendency to split but not nearly as bad as noted in many other places.

Aurora, as seen here, is a fine variety and has proved quite satisfactory as a good all round pink. Edna Craig on the other hand is badly diseased and the flowers are badly streaked. Grace Wilder is fairly good, but the blooms are also very uneven in color and split badly. Tidal Wave is good. All the above, with exception of Garfield as noted, are grown on benches.

At Mailander's establishment we find a number of houses filled with such varieties as Lizzie McGowan, Silver Spray, Hinze's White, Daybreak, Grace Wilder and Tidal Wave. Most of these are in solid beds and on the whole look thrifty. Hinze's White is coming in full crop now and until spring will yield a heavy cut.

Lindenberg is cutting some good carnations at present, principally of such sorts as Daybreak, Grace Wilder and Silver Spray. The latter though is badly rusted. Here we note the first batch of Mrs. Fisher we have met with, but Mrs. Fisher doesn't seem to relish our Chicago soil or climate, at any rate we have never seen a decent looking lot of this variety grown in our vicinity, and Mr. Lindenberg's are no exception to the general rule. The flowers are small and tinged with pink.

Poehlmann Bros. are into carnations quite extensively and show a number of very fine looking houses at present.

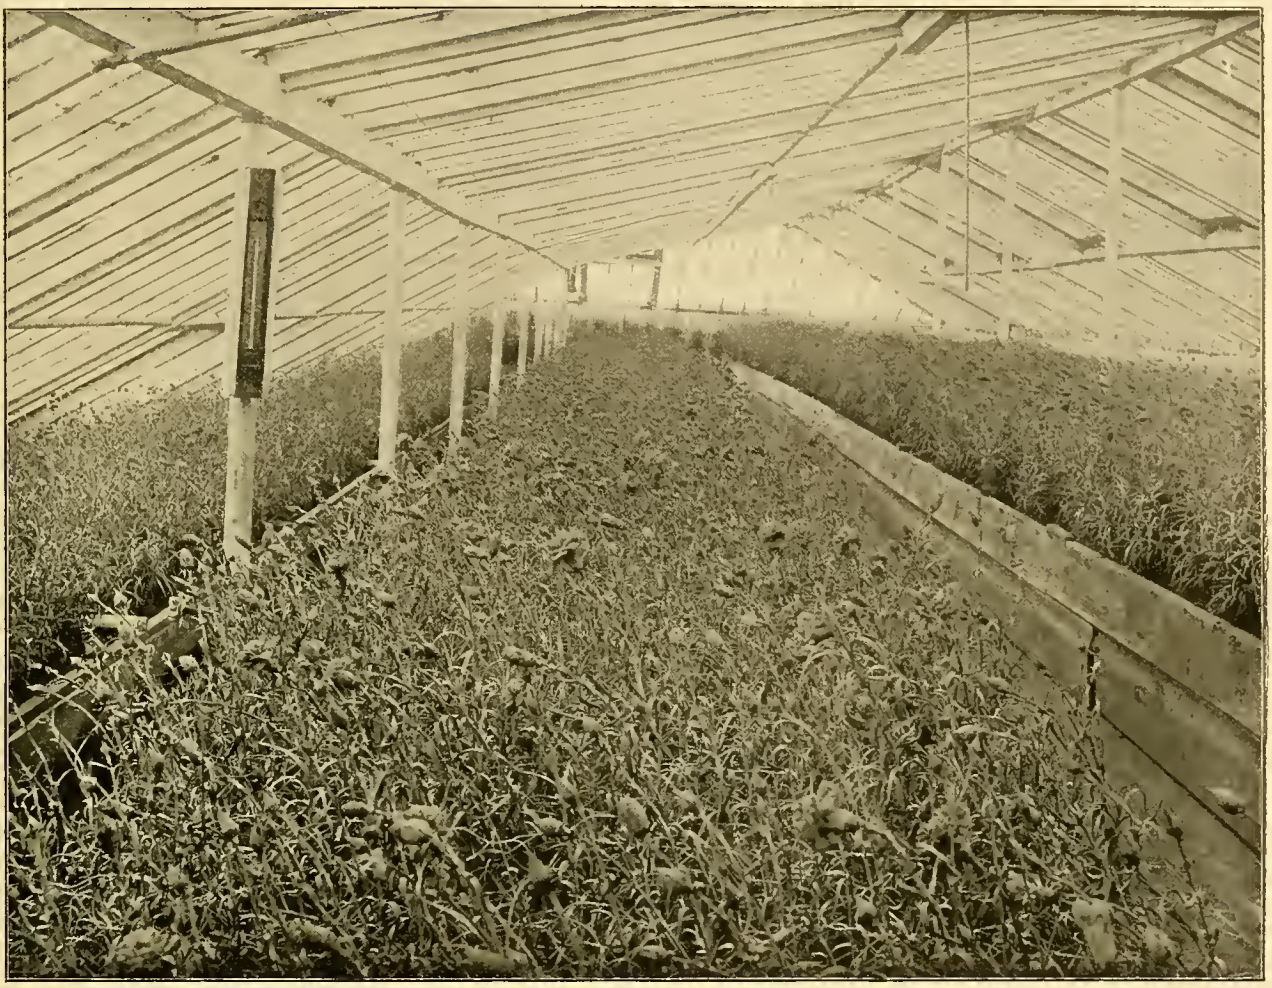
Silver Spray when seen last was the best lot we have noted, and with the exception of one or two small lots seen at other establishments the only stock which shows up in its old time vigor, and as far as we could notice without a trace of rust. The flowers, too, are of good size and form.

Hinze's White is grown quite extensively and is looking well. The flowers are larger than are often seen even of this variety, and when left on the plants until fully ripe nearly pure white. Although a late bloomer the Poehlmanns have always regarded this as one of their best paying varieties and intend to keep on growing it. These plants are grown partly in benches and partly in solid beds with very little difference in results except that the flowers produced from solid beds are a little larger.

Lizzie McGowan also looks well, but the flowers are not up to standard as regards size. Daybreak and Tidal Wave come fully up to the average, but Portia is rather disappointing although perfectly healthy and a prolific producer. The blooms are small.

Grace Wilder we note of better quality than seen at most places, but it is yet far from being satisfactory; as far as vigorous growth and soundness of stock generally is concerned there is little better to be desired, but the blooms are sadly deficient. While a few of the blooms are perfect and of fine color the greater number are both off color and ragged.

A small batch of Edna Craig are the first really good stock of this kind we have met in our rambles. The plants are perfectly healthy and produce flowers of extra size and beauty; it is only here and there we note a bloom that shows a tendency to fade, a fault we noticed too often in other places. The plants are grown in solid beds in moderately heavy soil.



B.

American Carnation Society.

The annual meeting of this society will be held at Indianapolis next Tuesday and Wednesday (February 20 and 21). Headquarters will be at the Dennison Hotel. The program is a very attractive one and the display of new varieties promises to be very large and of very great interest. On Tuesday evening the society will be banqueted by the state and city trade organizations. With such a combination of attractions there will undoubtedly be a large attendance.

House of Carnation Bouton d'Or.

Bouton d'Or is not a new carnation, having been in existence for several years, but it is practically new to the American trade, as it has not been disseminated here to any extent. A few carnation growers have imported the variety, but found it so difficult of propagation that it was discarded, and it was left for Messrs. Dailledouze Bros. to discover its good points and to introduce it to the American trade as the best yellow carnation ever offered. These growers claim to find no difficulty in propagating the variety, and as to its pre-eminence as compared with other yellows, in that quality so conspicuously lacking in carnations of this color, viz., free flowering, our illustration furnishes excellent proof.

HOUSE OF CARNATION BOUTON D'OR AT DAILLEDOUZE BROS., FLATBUSH, N. Y.

The flower itself is well formed and very full, color yellow with slight crimson markings.

Greenhouse Rhododendrons.

These beautiful plants are not grown nearly as much as they deserve to be, although they are becoming much more popular every year. They make one of the most effective of all winter flowering decorative plants and for Easter work are unsurpassed even by the favorite azalea. They can be brought into flower for Easter without any trouble, and by giving to them the same treatment as an azalea they do well. One thing is necessary—they must not be allowed to dry out during summer. They must be kept cool and moist at the roots during hot weather, or they will not make a good growth. After growth is completed give more sun, still not allowing them to dry out, to ripen the wood and insure the flower buds setting, then treat as to soil, attention and so on just the same as an azalea. The greenhouse rhododendrons are mostly hybrids of R. arboreum and the Himalayan varieties of R. ponticum.

R. ciliatum is a most valuable florists' variety on account of its dwarf habit and early flowering qualities. The flowers are in clusters of from four to five and varying in color from rose to pure white. R. Dalhousiæ is a noble species from the Himalayas. The large campanulate flowers measure about four inches in length and about as much across the mouth; they are produced in large dense heads and are white, tinged with rose, and very sweet scented; it blooms quite early.

Countess of Haddington is a very fine garden hybrid of very robust habit, the foliage very stout, bold and dark green; the flowers are very large, delicate blush white in color. R. Edgworthii: The leaves of this species are densely covered on the under side with soft ferruginous wool, the upper side being bright green. Flowers large, white and remarkably fragrant. Rather a late bloomer. R. fragrantissima is a fine garden hybrid; the flowers are large, pure white shaded with rose and very fragrant. It is one of the best greenhouse varieties. R. Javanicum is a fine species of good growth and habit. The flowers are large and golden yellow in color. R. Jenkinsii is a very fine compact growing species, forming a fine specimen; one of the best for conservatory decoration. Flowers large, funnel shaped and pure white. R. Nuttalli: This fine variety produces immense trusses of very large pure white flowers; they are, however, relieved by a tinge of gold in the throat, while on the outside they are suffused with rose.

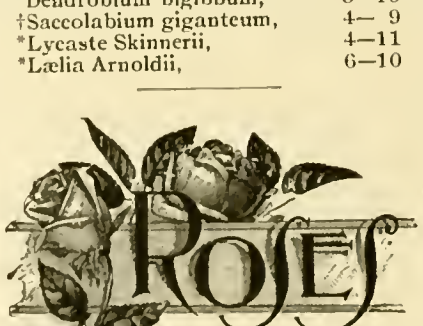
Prince of Wales is a fine hybrid, the flowers very long, tubular and of a bright orange color. It makes a good greenhouse plant. Princess Alexandra is a very free flowering variety; the flowers are long, tubular and pure white.

R. jasminifolium is a most beautiful and useful species. The flowers, produced in large umbels, are tubular, pure white and very fragrant. Princess Helena is a garden hybrid with long tubular flowers, delicate pink in color. This variety is of a dwarf bush habit and is a fine florists' variety. Veitchianum, very fine species; the flowers are large, pure white, stained with yellow at the base and beautifully crisp at the margins. R. Thibautianum is a peculiar and pretty species from Bhotan, the flowers much resembling the ericas; they are produced in terminal trusses, beautiful bright red, tipped greenish yellow. R. virgatum candidissimum is a very fine garden hybrid of very compact growth. The flowers are produced in large trusses and are pure white.

Princess Alice is a garden hybrid of dwarf compact habit. Flowers large white shading to blush, very fragrant and a very free bloomer. R. præcox is a dwarf bushy sort with small bright, glossy leaves. Flowers rosy lilac in color, remarkably free flowering, flowers very large. An early flowering variety and most useful for decorative purposes. R. Daviesii is a garden hybrid of fine habit and foliage. Very free flowering, flowers large, orange red in color. Duchess of Teck is a good growing variety. Flowers yellow and scarlet, very striking and showy variety. Duchess of Sutherland, a hybrid of good, strong, robust habit, flowers very large, pure white and very sweet scented. Fulgens, a hybrid of good growth with large fiery

crimson flowers, plant of very compact habit. There are many other varieties, but I have only tried to name an assortment of the best varieties for general greenhouse use. JAS. S. TAPLIN.
Madison, N. J.

Florists' Orchids.



we give below a list of orchids for the use of such florists as have a fancy for their culture, not so much for profit perhaps, but rather that they may never be without flowers.

They are arranged under the usual flowering months, after several years of culture. Newly imported plants flower in a more irregular way. The growing months are also appended, and here again newly imported plants are irregular in growth for a year or two, and this more especially applies to species from the southern hemisphere.

Such species as may be propagated by division or the separation of the back bulbs are marked with a (*). Such others as should be renewed from fresh imports are marked (†).

It is much more satisfactory to grow a select list of 50 or 100 good orchids each in quantity, which will cover the year with their bloom than to attempt the growth of a lot of stuff which may never bloom, or bloom but very sparsely. Most of the 60 I have selected may be depended on to bloom every season, and most of them will make blooming plants from back bulbs, etc., in from three to five years. or something longer than a lily or a tuberose.

Chicago Rose Notes.

NILES CENTER.

At Fred Sticlow's we find the first batch of Jacqueminots in full crop. The flowers are of very good color and size and with long stems, features we do not always find in an early crop. But then it is not so very early in the season either. Growers in this vicinity have found out by past experience that it doesn't pay to force this rose too early, and consequently few flowers appear in our market previous to February 1. The first blooms were cut January 20. The plants are grown in pots and started in batches of several hundred at a time at stated times to insure a continuous crop of blooms.

At the present writing, February 2, the first blooms on the hybrids are opening. As usual Mr. Sticlow's three houses of these roses are looking very fine and promise a heavy cut. The following varieties are grown: Ulrich Brunner, Mme. Gabrielle Luizet, Rothschild, Merveille de Lyon, Louis Van Houtte and Anna de Diesbach. These hybrids are all grown in solid beds and are not replanted but once in three or four years.

We also find a house of Jacques grown in solid borders. This house was planted some four or five years ago and has been a nightmare to Mr. Sticlow ever since. "Just take note of the canes on these plants," remarks Mr. S., "could they possibly be stronger or better? The wood is well ripened up, and yet the result will be as disappointing this year as it has been in former seasons. I cannot account for it. The canes break all right, but don't set any flowers. I am resolved to throw these plants out every year, but when fall comes and I see such splendid wood I am always tempted to give them another trial. Well, I am sure they will go this year."

The house of Beauties is not looking well at this writing. Most of the blooms are on short stems. The fall crop was very satisfactory.

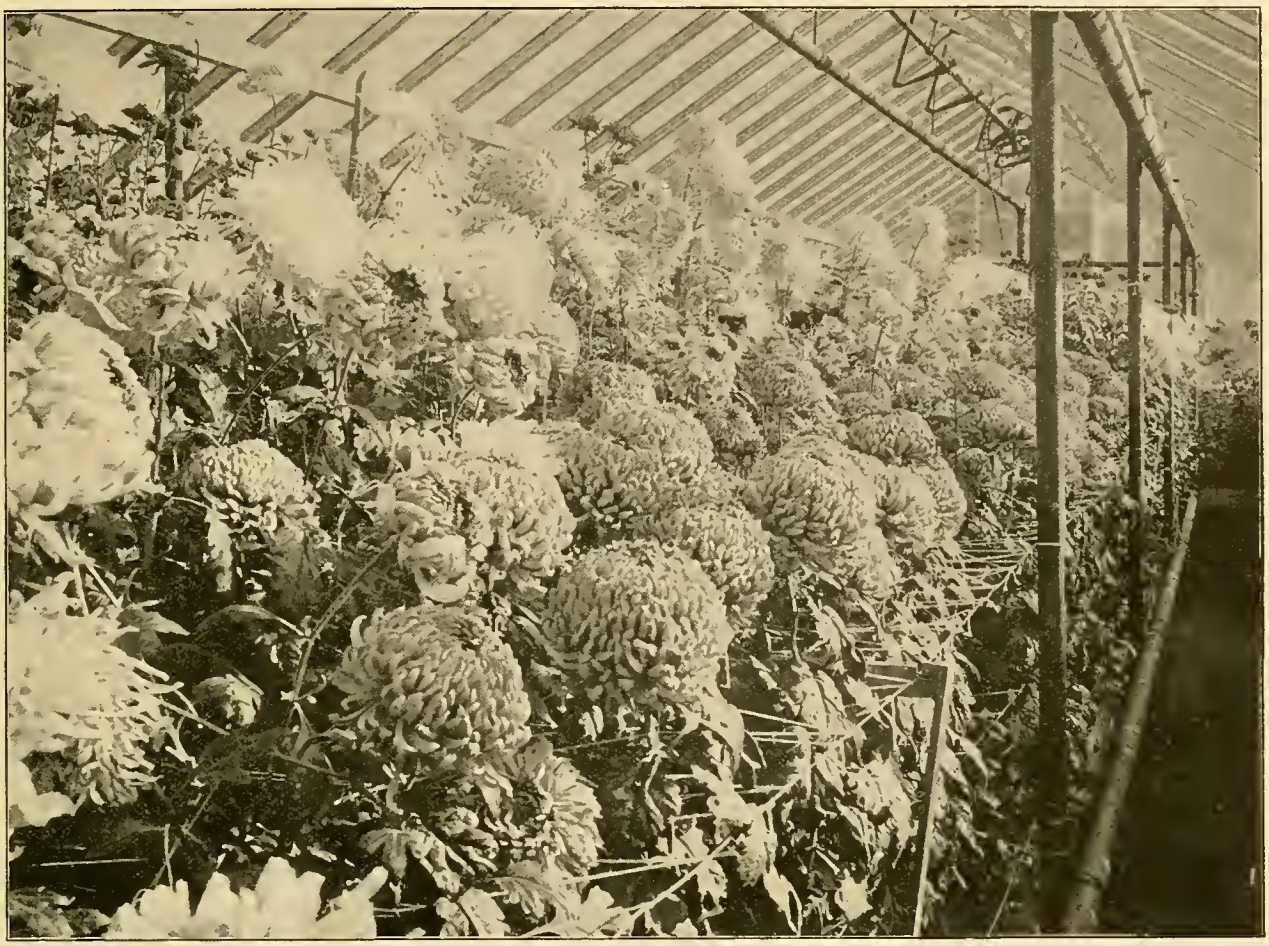
Several houses of Brides and Mermets are looking well. The latter variety is of very good color and good average size.

Gontiers have proved very satisfactory the entire season. The stock is two years old and grown in solid beds.

Meteor is doing but little in midwinter. The blooms, though few in number, are of fairly good color. La France about the same.

The bench of Cusins has done but poorly this year. This variety has been grown exceedingly well in former seasons on this place, and proved one of the best paying kinds. Mme. Pierre Guillot did fairly well up to midwinter, but is looking very poor now.

At Mailander's establishment we note a house of Woottons that look very fine. The blooms, though not as large as we have seen, are of fair size and remarkably good color. The plants are vigorous and altogether the best lot of this variety we have seen this winter. Brides look fairly well, and the same might be said of Mermets and Perles. Meteor also is doing well and now that the days are lengthening and we get more sun the crop will be abundant.



Speaking of Meteors, we may mention here that at all the establishments visited this winter, and that means nearly every place of note in or around Chicago, we have seen not one single bench that might be termed first-class, although we cheerfully admit that this rose on the average is grown much better this year than in former seasons, and as its requirements are better understood by the grower there is no doubt that the quality of the blooms will be much improved.

Madam Pierre Guillot here, the same as in other places noted, is an entire failure. It seems a pity that this beautiful rose cannot be grown successfully around here. It is one of the very best selling varieties on the market, and for table decoration, especially under artificial light, has few equals. But the growers are unanimous that it don't pay to grow, and so it will have to go, unless it be grown in summer.

Of Gontier we note three houses doing well, buds of good size and bright color.

A large batch of Jacques and hybrids in pots will be in shortly; the plants are well set with buds and promise some good blooms.

J. Meyer is devoting but little room to roses, but what is lacking in quantity is made up in quality. His bench of Beau-

HOUSE OF CHRYSANTHEMUMS AT MR. F. DORNER'S, LAFAYETTE, IND., WITH THE NEW VARIETY MAJ. BONNAFFON IN THE FOREGROUND.

ties is the finest of the kind we have seen this winter. Brides and Mermets too are of extra size and excellent color. These are produced on two year old stock planted in solid beds. One house of Perles grown on benches is a sight to behold; the wealth of blooms is remarkable.

Poehlman Bros.' range of rose houses is in splendid condition; with the exception of Beauties every bench is in fine shape. The following varieties are mostly grown: Mermet, Bride, Perle, Wootton, Gontier, La France, Albany and Meteor.

Adam Harrer is showing a good house of Perles, but many of the blooms are bullheads. Mermets and Brides are also looking fairly well, but the cut is not satisfactory. La France and Albany are doing poorly, and so is Gontier.

Peter Blaumeiser's place doesn't look as well as we have sometimes seen it. The roses are more or less mildewed and are also affected with black spot. There is a house of Jacques in solid bed which looks promising, and Beauties look fairly well.

At Lindenberg's there is a good prospect for a nice crop of roses from now on. The cut this winter up to the present was rather light. Most of the plants are two year old stock grown on benches and consist of the leading varieties of the older sorts. B.

Violets.

ED. AM. FLORIST:—Will you ask Mr. Edwin Lonsdale if he will kindly give (through your paper) his views on the culture of violets under glass, through the year; and thereby confer a great favor on the undersigned, and I doubt not, to the trade generally. E. G. BRIDGE.

The greenhouses best suited, according to my judgment, to the cultivation of violets under glass all summer are those having the short span to the south, believing that this style of house is cooler in summer than those generally in use, on account of the angle at which the sun strikes the glass. Thorough side ventilation in addition to that at top and as low down on the walls as practicable must in all cases form a part of an all-the-year-around violet house.

The house may be of any width best suited to the tastes and ideas of the owner, but that which would best meet the requirements of violets is one with a bed occupying the centre only of the house, and walks up each side and at the ends. The beds should be solid, and well drained and for convenience in picking the flowers and handling the plants generally they should not be less than two and a half feet high. The sides of the bed may be kept in position either by two inch planks or a brick wall may be built, or what I believe to be preferable to either is a wall made of concrete, as it is more lasting than the former and much cheaper and equally as permanent if well done as the latter. We have used for a similar purpose coal ashes and Portland cement, six parts of the ashes to one of the cement, with very gratifying results.

The plants should be placed in position as early in the spring as possible, eight to ten inches apart each way, according to the strength of the variety, and the glass should be very lightly shaded with white lead and naptha, or what perhaps would be better, one gallon of turpentine to one pint of boiled linseed oil; this checks the fierce rays of the sun without shading a great deal. If the plants are thoroughly clean from red spider or other insect pests when planted they can easily be kept clean if treated intelligently, as to watering, ventilating, weeding, etc.

There is no doubt in my mind that the lifting process which violets, carnations and some other plants which are used for winter flowering have to go through in the fall is largely the cause of much disease in this and similar classes of plants. In some soils and in some seasons these diseases are more prevalent than others, and of course some varieties of plants lift with greater ease and more certainty than others, and in some soils the root formation of a given plant is different to that which is made in other soils, and all these things have to be taken into consideration when experimenting. E. L.

WHEN SENDING us newspapers containing items you wish us to note please do not fail to distinctly mark the item so it can be easily found, as we can not spare the time to hunt through the mass of papers sent us for unmarked items.

New York.

Owing to the very stormy weather the Florists' Club meeting on Monday evening was slimly attended, but the proceedings were interesting and the members present made up in enthusiasm what they lacked in numbers. President O'Mara being still unable to attend, Ex-President Manda presided.

The treasurer presented his annual report, which showed a cash balance in the treasury of twenty-three hundred dollars.

The proposed palm garden and what share in its establishment the club should undertake was brought up and freely discussed and was finally assigned to the next meeting, a committee having been appointed to investigate and ascertain whether the club has any right to invest in such outside business.

An amusing discussion took place between Mr. Fred Storm and Alderman Morris regarding the methods of admitting new members and the advantages and drawbacks of secret ballots, investigating committees, black balls, etc.

Mr. C. W. Ward next took the floor in advocacy of extending an invitation to the American Carnation Society to hold their next meeting in New York City, and after some discussion the secretary was directed to forward such an invitation on behalf of the club to the Indianapolis meeting of the Carnation Society.

Messrs. Weathered and Manda then spoke in favor of holding an exhibition during the coming spring and this was favored by the meeting and a motion passed recommending to the incoming exhibition committee that such an exhibition be arranged for at the earliest possible date.

The chair then announced that there were two strangers present, Judge C. W. Hoitt of Nashua, N. H., and Mr. E. A. Wood of Boston, and called upon these gentlemen to address the club, which they did in a most acceptable manner, thanking the club for their generous treatment and expressing the kindly feeling entertained in their homes towards the New York club.

Cut flower trade is dull. The first indication of a collapse was on the day before Ash Wednesday, and since then there has been but little doing. Thousand rates are beginning to be quoted on roses, the mixed grades going as low as $15 to $20, and it only requires a little sunshiny weather to bring about the proper conditions for a Greek's paradise.

Boston.

A trip to the F. L. Ames greenhouses at North Easton is always a treat, for there is no time of the year when there is not something to see, but just about now the orchids are at their best, and Mr. Robinson is never tired of showing and talking about his pets. The time passes very quickly while listening to him as he enthusiastically and eloquently points out the beauties of the many rare and valuable gems in this the finest of all the orchid collections in America. Lælias in many rare forms, cypripediums in wonderful variety of form and color, odontoglossums without number, curious masdevallias, cattleyas in gorgeous array and a host of other interesting and curious things are now blooming. The stove houses have been rebuilt during the past season and the plants with their improved advantages and increased room are in splendid trim, while the big grotto with its palms, tree ferns, begonias and lycopodiums never looked better. Another North Easton establishment where the boys like to call is Mr. Gilmore's, where Mr. Thos. Greaves presides over the houses. There is no attempt to rival the great Ames collection, but Mr. Greaves always has something creditable to show and produces wonderful results from the rather limited opportunities which he enjoys.

The three New England members of the executive committee of the S. A. F. with a few of their friends were entertained by Mr. Edward Hatch on the evening prior to their departure for Philadelphia. The occasion was a grand send-off for the delegation and was altogether one of the merriest reunions amongst the fraternity here for many a day. The table was profusely decorated with flowers and plants. Mr. Hatch presided and close at his elbow sat Judge Hoitt, to give him inspiration probably. The four Falstaffs, Norton, Comley, Ewell and Dawson were all on one side of the table which was balanced on the other side by a row which made up in musical and mental attainments what they lacked in avoidupois. The speeches were in part congratulatory, Mr. Hatch having recently moved into a new and commodious office. The musical numbers formed a leading part of the program, Mr. Wood's "Sleigh Bells," Dawson's "Five Cripples," Allan's Scotch ditty, Ewell's improvised recitatives and other melodies being rendered in the most approved style. Mr. Comley told some of his experiences in Japan, Robinson gave an excellent recitation and Edgar's autobiography read by himself was one of the great events of the evening.

The effect of Lent has begun to be felt by the trade and there are signs that as soon as sunny weather is in order an accumulation of stock is probable. Roses are more abundant but are of such a good quality that prices have not yet begun to drop, although this may occur at any time now. Dana & Murphy are sending to N. F. McCarthy & Co. a lot of the finest Mermets and Brides. These Mermets are rivals in color for the best Bridesmaids. Harrisii lilies move very slowly, and bulbous stock in general shows but little life.

The Florists' Bowling Club met the South End Bowling Club on Friday night and turned the tables on them to the tune of 179 points, and Messrs. Elliott, Foster, Coleman and their associates on the team are carrying their heads high as a result. Judging from the interest recently developed here Boston's team will likely be heard from at Atlantic City next August.

Mr. C. M. Atkinson has been seriously ill for the past week. Mr. Thos. A. Cox is also on the sick list.

In town: Mr. H. W. Gibbons representing Hitchings & Co., New York.

Philadelphia.

The February meeting of the Florists' Club was well attended and the proceedings were of a very interesting character. Mr. J. L. Dillon of Bloomburg and Mr. James Dean of Brooklyn were among the visitors. Remarks eulogistic of Mr. G. W. Childs, who for some time had been an honorary member of the club, were made by several of the members. Mr. Robert Craig spoke in behalf of the national society and said that as long as life shall last Mr. Childs' name would ever live in their memory. Mr. Dean also spoke feelingly and said that while the local horticultural bodies would feel keenly his loss it would also be felt by the whole country at large.

Mr. Burton's paper on the most profitable roses for winter forcing was not read, as the arrangements for the S. A. F. executive meeting and meeting of the society at Atlantic City took up so much time.

Mr. Dean was called on for some remarks. He spoke of the interest the Phila. members seemed to take in their club, and was glad to see they were so united. He predicted a large and enthusiastic meeting at Atlantic City in August next. His thoughts then drifted to the carnation, which subject, by the way, seems to be contagious, as everybody appears to be getting the craze in some form. The improvements in this flower he said had exceeded all others in the past five years and he thought a great deal of the credit was due to the Carnation Society, that had done so much to boost the flower. He predicted, or rather said it was stated, that not only $7 and $12, but as much as $25 per hundred would be obtained for choice flowers in the near future; that the model flower now must be at least three inches across and the stems two feet long. In speaking of chrysanthemums he cautioned the growers not to try to get them larger. They were large enough. It was not size, but perfect form, good colors and keeping qualities that should be sought for.

Mr. Dillon said that he came to learn and he was glad to hear that carnations were going to bring $25 per hundred. He said, however, that carnations could be grown too large; he considered perfection in color, form, fragrance, stems and foliage better than size.

Mr. Lonsdale spoke of carnations seen on his Boston trip. Among others that impressed him he spoke of Jacqueminot, which he thought would be a winner. He said to Mr. Dillon's qualifications should be added size, for carnations could not be grown too large if they had all the other good qualities.

There seem to be a great many carnations about at the present time, yet the price holds up very well. The majority are now selling at $1.25 to $1.50 per hundred; choice stock, however, brings $2 to $3, and some Edna Craigs $4, while Helen Keller is now down from 7 to 6, a remarkable drop. However, in spite of the retail price, from $1.25 to $1.50 per dozen, it is being asked for by name over the counter.

Roses are plentiful, although there is no glut. Prices have not fallen any as yet on account of the Lenten season, which, by the way, except for a day or two, has not had any detrimental effect on business. The mild, spring-like weather of the past few days has helped the plant trade considerably and flowering plants have moved quite lively.

Brunners have dropped a bit in price, but it is on account of their quality rather than for any lack of demand. The earliest Brunners seem to have been the best this season, as those coming in now are too single and have not the rich color and beautiful form which makes this rose so handsome. K.

Chicago.

The proceedings at the last meeting of the Florist Club were quite informal but decidedly interesting. There was a general discussion of a dozen different subjects of trade interest, and several speakers told some excellent stories to illustrate points made. Mr. A. Ringier, salesman for W. W. Barnard & Co., told of a big dog owned by that veteran grower, August Dressel, which had been so edu-

cated by his master that when any one said "bulbs" in his hearing he would show his teeth and growl. Mr. R. brought down the house by naively adding, "I am afraid that tulip bulbs will be reasonable in price this year." Mr. R. announced that one grower had admitted to him that he had made money on Roman hyacinths this year. But he refused to give the gentleman's name which was at once loudly called for.

All agreed that trade was very dull, and still there is very little first-class stock in the market. All really good flowers are quickly snapped up. In view of the scarcity of good flowers may be it's just as well that the demands upon the retailer are no greater than they are. The scarcity of good American Beauty roses was specially noted, and Mr. Anthony called the attention of those present to the value of Ulrich Brunner to supply the shortage of American Beauty at this season. American Beauty is nearly always about run out by the holidays, and in this market there is always a shortage of large roses in January and February. He believed there was a fine chance to make money for any grower with proper facilities who would bring in the Brunner during the months noted.

Orchids have now become standard stock in this market. Though most of them come from outside Mr. Anthony has of late had so many more than was called for by his retail trade that he has been sending quantities to a commission house. He grows mainly cattleyas and said he could cut 200 fine blooms now for any one that wanted them. Corbrey & McKellar have had a particularly fine stock of orchids of late. On a recent occasion their ice box contained more orchids than were ever before seen together at one time in this city.

Mr. Kirkham brought up the subject of enlarging the club's library and allowing members to take books home with them between meetings. The suggestion was favorably received and a committee appointed to put it into practice.

President J. T. Anthony is in Philadelphia attending the meeting of the executive committee of the S. A. F.

Several Chicago florists will attend the coming meeting of the American Carnation Society at Indianapolis.

Mr. W. J. Smyth has sold his greenhouses at 160 43d street to Mr. J. Blauck who will conduct a general business. Mr. Smyth retains his store at 256 31st street and will again be a retailer only.

The Horticultural Society of Chicago has issued the premium list for its chrysanthemum show of 1894. The cash premiums amount to $4,189, of which $1,091 is offered in prizes for chrysanthemum cut blooms, $1,010 for chrysanthemum plants, $395 for other plants, $688 for cut roses, $240 for cut carnations, $120 for other cut flowers and $645 for floral arrangements. In the chrysanthemum cut bloom section prizes of $50, $35 and $25 for vases of 50 blooms each of white, yellow, pink, crimson, bronze and any other color are a leading feature and should bring out a grand display. In chrysanthemum plants the leading prizes are for single specimens of each of the leading colors and groups of plants grown to single stem and flower. A departure is the heavy increase in the prizes for vases of roses. Fifty blooms to a vase is the rule and in the majority of cases the prizes are $15 for 1st and $10 for second. The show is arranged to be open seven days, beginning Saturday, Nov. 3, and closing Friday, Nov. 9. The rules require that all the plants and chrysanthemum flowers (except seedlings) shall be in position by 11:30 a. m. of the opening day. On the third day occurs the first competition in roses, carnations and other cut flowers. On the fourth day prizes will be awarded on seedling chrysanthemums and mantel decorations. On the fifth day the second competition in roses, carnations and other cut flowers takes place. The feature for the sixth day is the table decorations, for which prizes of $100, $75 and $50 are offered. On the seventh and last day the special attraction will be baskets of orchids, roses and chrysanthemums and set of bride's and bridesmaid's bouquets. A new feature that we should have noted above is the offering of liberal prizes for vases of *fifty* blooms of carnations in 24 classes, named varieties, except 4 classes for new introductions. It is certainly a liberal list and it will undoubtedly bring out a display of which the society may be proud and that will, if properly advertised, make a satisfactory showing at the box office. Copies of the list may be had on application to the secretary of the society, Mr. W. C. Egan, 620 Dearborn avenue, Chicago.

Business so far has dropped off greatly since Lent began; it is said that Ash Wednesday was about the quietest day on record in the trade, and prices already show the effect of the change. On Monday and Tuesday the effect of the great storm was felt in the local market, both days being exceedingly dull. There was no difficulty in getting the stock in on Monday, as it was usually shipped before the roads were blocked, but some delay was experienced Tuesday morning. It is quite likely that some of the shipping orders were delayed after leaving the city.

In roses there is still a lack of good Beauties; they are worth from $1.50 to $4 a dozen, according to quality. There is still a preponderance of short-stemmed and malformed flowers, which are entirely unsalable. It is a pity there are no Brunners to fill up the gap, but none of this rose are expected from local growers for another fortnight, by which time prices may be better. Meteors are mainly very dark in color, almost black, and quite a few are poorly formed; the best sell for $7 a hundred. Wootton and Bridesmaid are good at $6; Perles go at $2 and $3, and there are many very small flowers among them. Mermet, Bride and La France are down to $4, and are fairly good in quality. Carnations are increasing in quantity; ordinary varieties are $1 to $1.50, fancies $2. Quite a lot of Buttercup has been received lately, but this does not sell nearly as well as Daybreak and Scott. Edna Craig comes in limited quantity, but growers complain that it is not very free.

Violets may be named as the one flowers which continues in brisk demand; they are $1 to $1.50. Mignonette varies from $1 to $2.50. Singularly enough, after being the greatest possible drug for months, Romans have taken a jump and are selling well at $2 to $3. Valley is rather slow at the same price. Daffodils do not go as they ought; they are $3 to $4, but sell slowly. Tulips are very variable; one day they sell, another they do not. Some fine Chrysolora go, and some extra Kaiserkroon have gone at $5, but most of them are cheerfully sold at $2.50. Smilax doesn't go at any price; it has been stagnant all winter.

Ransom E. Kennicott, oldest son of Amasa Kennicott, was married February 14 to Miss Clementine Roland of Freeport. Mr. Kennicott has settled at Carbondale, Ill., where he will grow for the Chicago market the same lines of hardy flowers as are grown by his father at the old Kennicott place.

Washington.

The Japanese Minister and Mrs. Tateno gave an elegant dinner party recently at the legation in honor of the Secretary of State and Mrs. Gresham. The table decorations were in green and white. Three large plats of Puritan roses and adiantums were on either side of the table. In the center was a silver candelabra capped with green shades, resting on a white satin square embroidered in gold. Decorative plants were arranged in the drawing rooms, the chandeliers were festooned with asparagus and the mantels banked with spring flowers fringed with maidenhair ferns.

At Mrs. Secretary Graham's breakfast at the Arlington Hotel in honor of Mrs. Cleveland the decorations were in pink and green. The cloth was strewn with roses and asparagus. At either end of the table were oval plats of pink carnations with a centerpiece of extra La France roses and maidenhair ferns.

Secretary of the Interior and Mrs. Hoke Smith recently gave a dinner in honor of the President and Mrs. Cleveland. Their elegant home was handsomely decorated, the colors used being white and green. The dining room, which is octagonal in shape, was a bower of bloom. From the center of the ceiling radiating to every part of the room were countless strings of asparagus dotted with white camellias, forming a complete canopy. In every detail the features of a typical Georgia feast were carried out, the camellia being the flower of the state. In each corner of the room were small groups of decorative plants reaching to the ceiling. The large mantel was banked with adiantum and studded with camellias, relieved with valley and giant mignonette. The mirror over mantel was festooned with asparagus and here and there was fastened a bunch of valley. The buffet was handsomely decorated with asparagus and valley, Romans and mignonette. The centerpiece on the table was an oblong silver bordered mirror, about the edge of which was a garland of camellias resting on a wreath of asparagus, the inner edge of which was fringed with valley. A tall silver centerpiece with four arms, each supporting a very handsome cut glass vase, rose from the center of the mirror and held lilies of the valley and other spring flowers, including some of the finest giant mignonette it has been my pleasure to see this season. This centerpiece was a very handsome thing, reaching almost to the chandelier, yet so light as not to obstruct the view across the table. Smaller mirrors of the same kind were similarly bordered, forming a wreath around the center. Encircling the table forming half wreaths about each plate was a garland of lilies of the valley. Dainty little green wheelbarrows holding pistachio almonds, for each guest, were tied with narrow green ribbons, through each of which were sprays of valley and above which poised white butterflies. The idea of green and white was even carried out in the gown worn by the hostess. In the entrance hallway in the corners were tall bay trees covered with white camellias To the average guest they looked like camellia plants in full bloom. On either side of the fireplaces were great clusters of lilies. This was probably one of the largest decorations of the season, if not the largest, and was executed in Mr. C. F. Hale's best style.

St. Louis.

The regular monthly meeting of the Florists' Club was held during the past week and owing no doubt to the interesting matters that were expected to be acted upon there was an excellent attendance. The committee appointed to revise the constitution and by-laws at last reported and as the changes suggested were numerous and radical the better part of the afternoon was taken up in discussing the proposed changes. The most important matter allowed was the providing for the admission of honorary members. This it is thought will greatly strengthen the club, and bring it into more intimate contact with the flower lovers and buyers of this city. The suggestion regarding the holding of the meeting in the evening rather than in the afternoon, was promptly sat upon, owing to the number of members present who lived out of town and would be unable to attend if the sessions were held in the evening. The attempt made to raise the initiation fee and dues resulted in the annual dues being raised from two to three dollars.

The secretary read a communication from the trustees of the Shaw estate, and announced that the Shaw medal had been presented to the club. It was ordered that it be suitably engraved and forwarded to the winners.

A paper on carnations was then read by Mr. Carroll, in which he thoroughly covered the history of that plant as well as the methods of growing the commercial varieties of the present time. To show that he understood what he was talking about, there were present from his place a fine vase of different varieties, notable among them being Albertini and Dorner. Mr. Fillmore followed with a short paper on the same subject giving the facts which he found to be most essential in the successful growing of the Divine flower; his remarks all through showed they had been drawn from experience and successful practice.

Prof. Trelease of the Missouri Botanical Gardens, (who had been presented with a carnation plant suffering from nematoids), read a short paper covering the life history of the nematoid, explaining the manner in which it increased, and did damage as well as the inability to reach it with any means at our command and owing to being *in* the plant. There was passed around during the reading of the paper, an enlarged drawing of the various points touched on in his remarks which made them additionally plain.

Owing to the lateness of the hour, the question of holding a show, which was to have been decided at this meeting, was referred to a committee composed of Mr. H. Young, E. H. Michel, and Frank Fillmore, with instructions to report at the next meeting.

The market still remains firm. The fact that Lent has begun has had no appreciable affect. This is about as was expected, as trade for the past several months is not of a kind to be at all affected by Lenten devotions. Good stock is still scarce and goes at once, and the probabilities are bright for a good spring season. R. F. T.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

CONTRACT NOW for FORCING ROSES

for your next season's planting and secure well rooted stock grown specially for your order. Last year, owing to the heavy demands made upon us at planting time, we were unable to fill many orders, thus disappointing our customers. We are now contracting to grow, for delivery when wanted, the leading varieties of forcing roses—including the new kinds. **BRIDESMAID**, the best pink grown; **KAISERIN** and **TESTOUT**; also Meteors, Beauties, Woottons, Brides, La France, etc., etc.

We earnestly request intending purchasers to submit us a list of their wants, and we will be pleased to quote them special prices for strong, well rooted plants to be delivered when they may designate.

We make a Specialty of Growing Roses for the trade. Having experienced and competent growers. Our stock is first-class in every particular and we **guarantee satisfaction.** Of the many hundred unsolicited testimonials we append the following: "Roses got of you last year have been the best bearers we have in our houses. RIVERSIDE FLORAL CO., Marshalltown, Iowa."

Order Early and secure the Best.

Atlee Burpee & Co., Philadelphia, Pa., seeds, live stock and poultry.

DETROIT, MICH.—Quite a little ripple has been caused in the trade here by the action of a "leading" florist, who, in his philanthropic endeavors for the advancement of horticulture, is advertising various palms, including chamærops, seaforthias and kentias, rubber plants and "Australian fir trees" in 5-inch pots (araucarias?), all for 25 cents each. It is hoped, for the benefit of buyers, that he throws in a pocket microscope with each plant.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer, 114 Chambers street, New York. Next annual meeting second Tuesday in June, (will probably be held in Toronto.)

MR. CHAS. BATES is no longer with the house of Vilmorin, Andrieux & Co. of Paris.

FROM May 1st until September 30, next there will be held a horticultural exhibition in Erfurt in connection with industrial exhibits. Great efforts are being made to make it a success.

OUR trade directory and reference book for 1894 will be issued next month. Send your order now for a copy. Price $2.

Baltimore.

Surely, if mild weather will do it, we should have a great crop of flowers Easter; for, although now and then comes a day or two of severe frost, the weather generally is very mild, and a few days this week would have passed respectably for part of May.

Tulips are in plentiful supply, roses and carnations are coming in freely. Philadelphia is unloading valley, Romans, etc., on us in quantity, and altogether, the prospects of more or less of a glut before Easter seem more probable every day.

The Exchange has moved again, to 229 Park street this time, where new counters, ice box, and cashiers desk, all finished in cherry and brass give a tone to the business, and provide a suitable setting for a jewel of a manager and the beautiful products of the Baltimore county greenhouses. It is a great improvement in every way.

Why do we never see a registering thermometer in a greenhouse? Is it any less necessary to know the extremes of daily temperature in them than it is in breweries and other places where they are used?

Mr. R. J. Halliday's many friends will be pleased to hear that, though still far from strong, he is sufficiently recovered to be at his store. MACK.

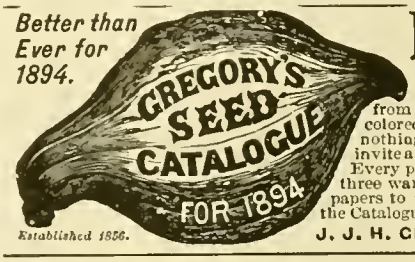
NEW CROP ONION SEED

$1.00 PER POUND — Either RED WETHERSFIELD or YELLOW DANVERS.

$2.25 PER POUND for American Grown Prizetaker,



In lots of FIVE POUNDS of one kind or assorted as desired. With every $5.00 order goes FREE a copy of Greiner's Newest and Best Book, "ONIONS FOR PROFIT," telling all the Secrets of Success in Old and New ONION CULTURE.

If You Garden for Profit

you can save money and should buy at Wholesale Prices, as quoted in BURPEE'S BLUE LIST for 1894. It is mailed FREE to Market Gardeners everywhere, who, while entitled to *the lowest prices possible*, should always be sure to get Only the Best Seeds That Grow! BURPEE'S SEEDS ARE WARRANTED,—*few equal, none better*—and are annually sold direct to many more planters than are the seeds of any other growers.

W. Atlee Burpee & Co., Seed Growers, Philadelphia, Pa.

☞ If you have not already seen BURPEE'S FARM ANNUAL for 1894, write for it TO-DAY. A handsome book of 172 pages, it is pronounced by papers everywhere *The Leading American Seed Catalogue*. It tells all about the Choicest Vegetables and Most Beautiful Flowers for THE HOME GARDEN.

Is Different from Others.

It is intended to aid the planter in selecting the Seeds best adapted for his needs and conditions and in getting from them the best possible results. It is not, therefore, highly colored in either sense; and we have taken great care that nothing worthless be put in, or nothing worthy be left out. We invite a trial of our Seeds. We know them because we grow them. Every planter of Vegetables or Flowers ought to know about our three warrants; our cash discounts; and our gift of agricultural papers to purchasers of our Seeds. All of these are explained in the Catalogue, a copy of which can be yours for the asking.

ADDRESS **E. B. JENNINGS,**
WHOLESALE PANSY GROWER,
Lock Box 254. **SOUTHPORT, CONN**

Ottawa, Canada.

The fifth annual dinner of the Ottawa Gardeners' and Florists' Club was held in the Queen's restaurant in the capital on Monday night, and proved the most successful yet enjoyed by the club. Mr. H. F. Sims, president of the society, occupied the chair, the croupiers being Mr. Charles Scrim and Mr. James Hickey, vice-presidents. About 50 members were present, and after a rich menu card had been discussed with self evident appreciation, a lengthy programme of toasts and music was entered upon. After the usual preliminary toasts had been disposed of matters of vital importance and great interest to the club and the profession generally were talked over. Among the subjects before the company were "Horticultural interests," "Central Canada Fair Association," "Gardeners' and Florists' Club," "The press" and other subjects. Each of these received careful handling by the different speakers. These remarks were interspersed with songs and recitations, while at intervals a full orchestra rendered a number of pieces during the evening. The affair was pronounced by all to be an unqualified success. M.

Botanic Gardens.

New York is waiting for that $1,125,000!! Now do you know that every *hardy* plant in commerce may be bought for $1,500, and that (for all reasonable duplication) $12,000 would suffice to plant a garden? Cost of ground would depend upon location. Often it is cheap as well as convenient and good.

Architecture and road making!! That's where the money goes. Bah! Neither make gardens. They often render them impracticable. JAMES MACPHERSON.

Trenton, N. J.

DO YOU WANT an alphabetical list of the chrysanthemums in commerce in America, with class and a brief accurate description of each one, and synonyms noted? You will find such a list in our trade directory and reference book.

CARNATIONS.

Varieties good. Cuttings good. Lizzie McGowan, Silver Spray, Aurora, Grace Darling, Portia and J. R. Freeman, at $1.25 per 100; $10 per 1000. Fred Dorner, $2.00 per 100; $12.50 per 1000. Daybreak, at $2 50 per 100; $20 00 per 1000. Edna Craig, $3.00 per 100; $25.00 per 1000.

Annie Pixley and Helen Keller.

PIXLEY is one of those beautiful light pinks, with a fair sized flower and good, strong calyx. With ordinary culture stems can be cut twenty inches long. The flower is a model in form, and the growth is strong and healthy.

KELLER you know all about, they are both sure to make good paying varieties for cut flowers.

Pixley per 100, $12.00; per 1000, $100.00.
Keller per 100, $12.00; per 1000, $90.00.

Verbena Lancaster Beauty.

Decidedly the prettiest Verbena that grows, novel as well as beautiful and sells at sight.

Price, per 100, $2.00.

PANSIES.—I can still supply a few of those seedling plants at $5.00 per 1000, or 75 cts. per 100. The same good strain I always have.

No list published and terms are cash before shipping or C. O. D.

Coleus at $7 per 1000. Alternanthera, transplanted, Red, Yellow, Pink, $1.25 per 100; rooted cutting, $6 00 per 1000.

L. B. 496. ALBERT M. HERR, LANCASTER, PA.

EVERYBODY who sees the new and beautiful Fancy Carnation "HELEN KELLER"

are favorably impressed with it, and generally leave an order.

HERE IS A SAMPLE LETTER from a Carnation expert—C. H. ALLEN, Treas. Am. Carnation Society:

"After seeing the Carnation 'Helen Keller' growing at your place, I have concluded to order five hundred (500) plants. My only regret is, that I have not house room enough to warrant me in ordering three thousand (3,000), as the general habit of the plant, the size, coloring, and substance of the flower is in my opinion bound to make it a money maker."

Orders booked now and filled in rotation, commencing March 15, '94. Strong Rooted Cuttings, $3.00 per Dozen; $12.00 per Hundred; $90.00 per Thousand. $2.00 per hundred additional for plants from thumb pots. *Orders may be sent either to*

EDWIN LONSDALE, CHESTNUT HILL, PHILA. or JOHN N. MAY, SUMMIT, N. J.

The Jacqueminot Carnation . .

IS A PERFECT SUBSTITUTE FOR THE JACQUEMINOT ROSE.

Many buy it in preference because of its lasting qualities, and you can have it in bloom when the rose is out of season. Send for descriptive circular, enclose 10c. and we will mail you long stem sample bloom. The color is a bright crimson (no black in it). If the blooms look dull on arrival, they have been chilled or frozen. Notify us, we will ship again.

PETER FISHER & CO., ELLIS, NORFOLK CO., MASS.

4 NEW CARNATIONS FOR 1894.

E. B. LEWIS, Lockport, N. Y.

WM. SCOTT —AND— GOLDFINCH.

The former is the most prolific carnation we ever grew. It produces fully double as many perfect blooms as any other carnation we have ever seen. Of a most beautiful delicate pink, easy to grow and quick to sell. Goldfinch is a boon to florists for who does not need a good yellow; one that is sure to produce abundantly, large perfect flowers. Such as one we believe Goldfinch to be. Send for prices on these and all other leading carnations in the market.

GEO. HANCOCK & SON, Grand Haven, Mich.

The Yellow Carnation Bouton d'Or

WHAT WE CLAIM:

That it is decidedly a good, strong grower and free bloomer; color a beautiful yellow penciled with dark carmine. That it is of the best form and fully as large as Buttercup. That the calyx is perfect, the stem long and stiff, and the foliage possibly better than that of any other carnation. **Testimonials from the Largest Retailers in New York City.**

New York, Feb. 1, 1891.

Messrs. Dailledouze Bros., Flatbush, L. I.

Gentlemen—Your new Carnation "Bouton d'Or" is certainly the best of its color as yet in market, it possesses all the good qualities to make it desirable, viz large flower, stiff stem and splendid keeper. It will always be in demand in the retail trade. Signed Yours truly,
CHAS. THORLEY.

New York, Jan. 26, 1894.

Messrs. Dailledouze Bros.

Gentlemen—I have been handling your Yellow Carnation Bouton d'Or over a year, and consider it the best yellow carnation in cultivation. That it is a favorite with the public goes without saying, as I have never been able to keep it in my store long enough to tell it keeping qualities.
Signed Yours truly, CHAS. A. DARDS.

New York, Jan. 20, 1891.

Messrs. Dailledouze Bros.

Dear Sirs—I wish to testify to the good qualities of Bouton d'Or Carnation. Its the best yellow I have yet seen. It has proved to be a good seller, a fine keeper. We want more of it. Signed Respectfully yours,
P. L. BOGART, 907 6th Avenue.

New York, Feb. 5, 1894.

Messrs. Dailledouze Bros.

Gentlemen—We find your Bouton d'Or a first-class yellow carnation *more solid* than the Buttercup and better than any yellow we have handled.
Signed Cordially, WM. A. BROWER & SONS.

Messrs. Dailledouze Bros. January 25, 1894.

Gentlemen—We wish to compliment you on the qualities of your new yellow carnation Bouton d'Or. It is the best yellow carnation we have eve handled; being a splendid keeper, sells on sight, and will always be in demand. [Signed] Yours truly, J. H. SMALL & SONS.

"Bouton d'Or is certainly a good grower and free bloomer; a variety one can recommend with pleasure. I like it better than Buttercup."
W. ALBERT MANDA.

"Bouton d'Or is just the one we have been looking for, and is the nearest approach to the ideal carnation in its color yet introduced. The color is a clear canary penciled with carmine, firm texture, a full large flower—one just measured is three inches in diameter—exceedingly prolific as a bud maker; stems stout with clean, healthy foliage. I congratulate you in disseminating so grand a flower." SAMUEL HENSHAW.

All the best growers in the vicinity of New York City can be found on our books with orders from 500 to 1000 and upward. All the Carnation growers who see it grow order freely. Orders filled in strict rotation from March 1.

ROOTED CUTTINGS—Price $2 00 per doz.; $10.00 per 100; $75 per 1000; 250 at thousand rates.

VICK & HILL, Rochester, N. Y.

Toronto.

Lent is upon us and this pious city has put on sack cloth and ashes for a period of 40 days. Such frivolities as are dispensed at florists' stores will receive scant attention except from the few who delight in decorating their friends and relations who have departed this life with crosses, anchors, pillows, broken columns, etc. Of course there is always something doing, especially with the old established florists who have regular customers. All of us manage to get three meals a day with now and then a few extras thrown in.

Your correspondent has lately been in receipt of a good deal of abuse for not giving *full* particulars of the state of the trade here in his weekly notes. Well! he is quite willing to confess to the truth of the allegation, but he wants to know what good it would have done to the allegators or any one else supposing he had done as they desired beyond the pleasure of seeing other men abused in print and making bitter feelings more bitter still (which would not be good for them after all). He thinks that he may possibly be making a mistake in going even this far, but in order to make things clear would say that if a wholesaler chooses to start a retail store it is nobody's business but his own (the wholesaler's); if another man chooses to retaliate that is his (the retaliator's) business and nobody else's. He questions the good policy of both, but is confident that the more these matters are left alone (at least in public print) the sooner they will find their proper level and the better it will be for all concerned. After all, florists are only human, like other men, and want to make as much money in as short a time as possible, but the question comes in whether they could not make more money if in harmony with each other than by all being at cross purposes.

The idea of having a florists' section of the Gardeners' and Florists' Association, which has been mooted, seems to be a good one, and if the florists meet together firmly resolved to bury their private feelings and petty jealousies they can improve the present state of things, but if they meet with no ideas outside of self and each one's own narrow little world why it would be better not to meet at all. Sacrifice of bitter personal feelings is absolutely necessary in order to do any real permanent good to the trade at large. Let us all get out on to the broad expanse where we can do some good to our neighbor as well as to ourselves, it won't cost us anything (in money), there is much to be gained and we shall feel ever so much better for it. E.

A New Plant CALLED

Lychnis flos cuculi plenissima Semperflorens.

We are the first to offer this novelty in the United States. It is a variety which defies all description as regards rich bloom and the beauty of its delicate rose colored flowers. Valuable for a winter bloomer, the originator had flowers from it in profusion during the whole wiuter without any special care, it is perfectly hardy and will bloom from spring uutil frost and grows only 12 to 18 iuches high. An important testimony to the value of the plant is the fact that wherever it has been exhibited it has been awarded a prize, and at Eberswalde, Euten, Berlin and Hamburg was awarded a silver medal. A cut and full description of plant will be sent on application. **Price $3.00 per dozen.**

California Privet, 3 to 4 ft. $65 per 1000.
California Privet, 2 to 3 ft. $50 per 1000.
California Privet, 2 to 2½ ft. $10 per 1000.
California Privet, nicely branched 18 to 24 inches $30 per 1000
California Privet, lighter, $25 per 1000.
California Privet, 12 to 18 in. $18 per 1000.
Large Shrubs, several varieties, $6 per 100.

VICK'S NEW DOUBLE WHITE ANEMONE "WHIRLWIND."

A Double White Anemone is something entirely new. Proven by five years' trial to be permanent and perfectly hardy; habit like the well known White Japan Anemone—same strong growth and healthy foliage, and more abundant bloomer. Flowers two and a half to three inches across, have several rows of white sepals, and flowers last much longer than those of the single variety. Plants from two and a half to three feet high

HARDY, STRONG AND FREE BLOOMER,

decided advantages, and must make a demand for it on all ornamental grounds. Especially recommended for exposed situations and cemetary planting, where it is inconvenient to give winter protection. Strong plants ready for blooming.

NOVELTIES.
Branching Aster,
(Often sold for Chrysanthemum.)
Hibiscus, Sunset.
Dahlia, Ethel Vick.
Large Morning Glories.
Double Anemone. Charmer Pea.
Maggie Murphy and other Potatoes.

Two Proposed New Associations.

We have received a communication from Mr. R. C. Poppey, Foster Brook, Pa., suggesting the organization of the employes of florists into an association, which shall supply to members information regarding the desirability of employment with those seeking employes. His idea is for the employe who becomes a member to communicate to the designated officer of the association what information he possesses regarding the habits of the various employers he has worked for as regards payment of wages, general treatment, etc.—this information to be available to all other members of the association.

He holds that at present men frequently make journeys of considerable distance to obtain employment in response to advertisements and find when they arrive that the advertiser has a reputation for being very slow in paying his men or getting rid of them when their demands for payment become too importunate by being so rude and disagreeable that no self-respecting man can remain in their employ.

We are heartily in favor of any organization looking to the righting of wrongs of any kind, and it certainly is a fact that there are employers whom any man will do well to avoid. We trust that the organization will be formed and that it will meet the needs of the case. While it may be accepted as a fact that certain disgruntled employes will make unfavorable reports regarding some good men, the average will undoubtedly be all right and give the desired correct information in the case. But let no incompetent employe imagine that such an association would do him a particle of good.

As a logical consequence there would be at once formed an association of employers, who shall report to the headquarters of that organization their experience with employes. This organization would also be an extremely desirable one. It would be a grand thing to have on record the host of incompetent and dissolute men who now disgrace the ranks of the journeymen florists.

Let both of these organizations be formed at once that the white and the black sheep may be separated where we may see them and know them for what they are. Thus the white sheep will have an opportunity that they do not now possess, and which is frequently taken advantage of by the black ones on account of lack of information regarding them.

L. T. SEAVER,
THE PANSY KING OF AMERICA

presents to the public a revived novelty, which flower is a deep yellow round ball of great dimension, a great endurer as a vase flower, and a hardy perennial blooming until winter if cut back or potted in June. Its early popular favor dates back to Queen Elizabeth at Oxford, commanding there her great culture, it became known as the Oxford Globe; p ice 25 cents each. Also a dealer in Pansy seed, and a manufacturer of Pansy Baskets, size 10x5, 4 deep, price $11.00 per 1000.

Foreign Notes.

The leading horticulturists of Glasgow have taken steps to organize a chrysanthemum society in that city.

M. Maurice de Vilmorin will deliver a lecture before the Royal Horticultural Society on March 27 on "Rare plants and shrubs in the Arnold Arboretum, Boston."

The excessively warm weather in Great Britain was followed by a cold spell of unusual intensity during the first week in January. Zero weather was experienced in many sections where such temperature is a decided novelty.

The discussion over the action of the National Rose Society whereby La France, Augustine Guinoiseau, Capt. Christy and other roses were disqualified from exhibition in H. P. classes and placed in a separate class by themselves continues unabated in the *Journal of Horticulture* and makes very interesting reading.

With the new year *L'Illustration Horticole* returns to its old octavo form, which it abandoned some seven years ago to become a quarto. The initial number for 1894 contains a colored plate of Gynura aurantiaca which shows to perfection the velvety purple sheen on the foliage of this beautiful plant.

Pteris serrulata, var. gigantea, for which Mr. H. B. May received an award of merit from the Royal Horticultural Society in January last year, is credited in the *Gardeners' Chronicle* with being the perfection of a decorative fern. "It is free in habit, elegant in the arrangement of its fronds, quickly makes a salable plant and if grown on forms a noble specimen."

THE annual meeting of the American Carnation Society at Indianapolis, Tuesday and Wednesday of this week, was a grand success from every point of view as will be seen from the full report in this issue. Let the Chrysanthemum Society and the Rose Society take the hint and arrange for meetings at some other time and place than that of the S. A. F. convention. Come gentlemen of the rose and chrysanthemum, get up and shake yourselves. Simply make a start and the rest will follow. Don't let the youngest flower take *all* the attention of the trade. Begin at once. There is no time like the present. We will with pleasure report *your* meetings as fully as we have those of the Carnation Society.

WHEN SENDING us newspapers containing items you wish us to note please do not fail to distinctly mark the item so it can be easily found, as we can not spare the time to hunt through the mass of papers sent us for unmarked items.

Annual Meeting of the American Carnation Society at Indianapolis.

About fifty were in attendance when the American Carnation Society convened in annual session at Indianapolis last Tuesday, at 2:30 p. m. The delegates were heartily welcomed to Indiana's capital by Mr. J. S. Stuart, of Anderson, Ind., on behalf of the Society of Indiana Florists, to which response was made by Mr. C. H. Allen on behalf of the Carnation Society.

Mr. Stuart spoke as follows:

MR. PRESIDENT, LADIES AND GENTLEMEN, MEMBERS AND FRIENDS OF THE AMERICAN CARNATION SOCIETY: On behalf of the Indiana florists I welcome you here on this occasion. The calling of a florist is high and ennobling and to be a success one is brought into close proximity with the throbbing, beating pulse of nature. Through the providence of God our lives have been prolonged, our mental and physical bodies preserved, with hearts beating in unison of purpose and filled with one common desire, that of elevating this noble calling, do we thus come together on the occasion of this, our third annual meeting. I behold the faces of those who have devoted a life long service to the advancement of floriculture, men who have toiled early and late, advancing step by step in plant culture, ever learning lessons from nature which has peculiarly fitted them to be teachers and advocates of a higher standard in the florists' business.

Gentlemen and fellow florists, we welcome you here. The American Carnation Society was organized in the east. Its first meeting was held in Buffalo in 1892. Being ushered into existence in a state that numbers its florists by the thousands, composed of men with money, knowledge and enterprise, surrounded by so many congenial influences, its success was assured from the very start. The second meeting was held at Pittsburg in February last. In number, scope and character of the business transacted there it was generally conceded that all points in carnation culture had been touched upon. Twelve months have come and gone since that meeting and today we find ourselves in a wide field of mysteries in connection with the cultivation of the divine flower. The rapid strides in carnation culture have been checked to some extent; such questions as new varieties, disease, pot and bench culture, stock plants, propagation, etc., have come up with renewed interest and demand serious consideration. We welcome you to Indiana, a state crowded with grand achievements and rich with untold possibilities. We welcome you to our fair capital and railroad center. We welcome you as guests of the Indiana florists, we feel highly complimented and shall do all within our power to prove to you that the Hoosier loves his friends. Make yourselves feel at home and let us become acquainted. Work harmoniously together, and by united effort meet these perplexing difficulties. Thus by interchange of thoughts and recital of experience we shall elevate our calling and raise the carnation standard still higher. We live too low and breathe atmosphere too dense. Let us press onward and look upward, ever conforming our lives and labor more with the teachings of nature, and surely we shall become better acquainted with nature's God, and learn to recognize Him as the master switchman that makes no mistakes in the minutest order throughout the entire kingdom of nature. Again I say we gladly welcome you among us.

The first business taken up was the appointment of a committee on awards. Mr. A. M. Herr was selected by the Chester County Carnation Society, Mr. Eugene Dailledouze by the national society, and these two gentlemen selected Mr. C. H. Allen as the third member. President Hill then delivered his address as follows:

President Hill's Address.

GENTLEMEN, MEMBERS OF THE CARNATION SOCIETY: Your president deems it only necessary to make a few brief remarks on the anniversary of our annual meeting—this opening session. The year just closed has been an eventful one in the history of our favorite flower; its devotees have given increased thought and closer attention to the needs, necessities and proper culture of the carnation; under the stimulus of increased love and demand of high grade carnations new varieties are being raised and disseminated; great care should be exercised in the bestowal by this society of medals and certificates; exalt the standard; better that disappointment should occur than that this society should endorse any variety that does not measure up to the very best—or a little better—than any at present in commerce. On the other hand it is important that proper encouragement be given to those working on these lines of raising new varieties. The propriety and advisability of holding a carnation exhibit of itself originated with our Chester County friends. This is a move in the right direction; the thought and purpose are commendable. Let us be aggressive and push out into new fields, make new conquests and thus signalize our faith in the future of the "divine flower."

It occurs to your president that the

holding of an exhibition would be a most useful topic for discussion, for it is a matter involving, in a measure at least, the onward movement in carnation culture which the society has so auspiciously inaugurated and set in motion. It is a question with your presiding officer whether a successful exhibition of carnations could be held without the employment of vast numbers of carnations grown and flowered in pots. The culture of carnations in pots is of very limited practice, hence the need of preparation for so important an event. Another vital question is, how can we preserve in fresh condition the cut blooms exhibited? it is an undeniable fact that the majority of carnations exhibited at the various autumn chrysanthemum shows have withered and have been unpresentable the day following their entries—"gone to sleep," as Mr. Lonsdale puts it—hence the hesitancy and slowness of the managers of chrysanthemum shows to offer large sums or premiums for carnation exhibits. These are facts incident to exhibiting carnation flowers at the shows. Let us meet these and other questions that confront us in an intelligent and thoughtful manner.

The thorough and comprehensive discussion of the diseases incident to carnations at the meeting last year is one of the events in the society's history that it may well be proud of. The defining of the different diseases, so that those unacquainted with their insidious work could locate and know the nature of their development, was an educational work of great value to all interested in successful carnation culture, and from the innumerable expressions from men in the trade we are led to believe that the information given was thoroughly appreciated and valued.

Your president is thoroughly convinced of one thing, as a result of the discussion at Pittsburg, and that is, there must be a complete stop to the propagation from plants that are forced for flowers if we would maintain the health and vitality of the carnation. If we continue to propagate from the plants forced for flowers it inevitably follows that an impaired constitution is imparted to the propagated plants from such stock. Let no sophistry or money consideration blind us to this truth, however unpalatable and unwelcome the fact may be. When we select and propagate our stock from plants grown in a moderate temperature and under normal conditions, then and not until then will bacterin and other diseases cease their ravages. We may as well begin to adjust our methods to this imperative command, for reason and right culture point to separate plants under normal conditions to be used for propagating purposes alone; the cost of propagating will be enhanced, but if we can restore the health and vigor the increased cost of stock will be gladly met. It is essential from another point of view that we seek to restore to the carnation all its vigor and health, i. e., that the progeny seedlings may be able to maintain and produce the larger sized and better shaped flowers which recent introductions have given us.

Man, with great brain power and culture, what is he unless he has behind the brain a strong, healthy physique. If bacterial diseases are to sap the life of our Edna Craig, Mme. Albertinia, Wm. Scott, Grace Battles and other improved varieties, what profit if we have increased size and fine colors. Let us as a society seek to know all the truth as to culture, and if cultural methods are at fault let us be fearless in pointing out that which is right and in consonance with the life, health, vigor and perpetuity of our loved carnation.

The history of this society is an enviable one; its accomplishments are ascertained facts regarding culture, the diagnosis of diseases, the stimulating of efforts to raise new varieties, to say nothing whatever about the exchange of experience and good fellowship which accompanied our annual gathering. While glorying over the things achieved, let us eagerly and with firm tread press on for future conquests; old shoes are easy to wear; long trodden paths are easily traversed; let us as a society endeavor to solve the problems confronting us, to raise the standard of carnation culture from the region of the speculative to that of an exact science.

Someone has said "That no one could define the limits or obstruct the march of a progressive, energetic and enlightened nation"; the same holds good regarding a profession and if we continue in our quest for knowledge and information, who, I ask, can limit the good or stop the march of the American Carnation Society?

Discussion upon the address was deferred, and Prof. J. C. Arthur being present he was called upon to read his essay which appears in full below.

The Discrimination of Diseases without the Use of a Microscope.

BY PROF. J. C. ARTHUR, BOTANICAL DEPARTMENT, PURDUE UNIVERSITY.

"Never before in the history of man have agricultural plants apparently suffered so greatly from parasitic vegetable growths and injurious insects," says a writer in a recent number of *Popular Science Monthly*. The force of this assertion doubtless lies in the word "apparently," and keeping that in mind we could extend the remark with hearty approval from agricultural to all other classes of cultivated plants.

The carnation has been considered among the class of flowers least subject to disease, and for many years no one heard of a real carnation disease. Sometimes plants did not grow well, and then it was said they needed a different soil, or not so much water, more ventilation, less heat, or there were worms in the earth, but clearly defined diseases were practically unknown. Five years ago Professor Seymour published an illustrated account of a spot disease of the carnation (*Septoria Dianthi*), which turned the attention of both florists and botanists to a closer inspection of the carnation bench. But this was only a summer cloud, that raised no particular apprehension. The real storm burst upon the carnation world when the advent of rust was made known three years later. Every defect in the green part of the plant was now suspected to be rust, and not a little disturbance to trade and mutual confidence developed from the inability to definitely recognize this dreaded disease.

In 1889 Mr. William Falconer wrote, apropos of Mr. Seymour's article: "This whole question of plant diseases is one of vast importance to us, but practical men like myself are absolutely unfit to grapple with this subject: it is a matter for the scientist. We can understand fairly well anything we can see plainly, but the obscure diseases bother us. It isn't enough for us to say, 'Oh, it's some sort of a fungus.' Be precise, know for a certainty whether it is a fungus or not, and if a fungus, what fungus it is; also whether the fungus is the cause or the effect." No wiser suggestion could have been made, and the carnationists seem to have taken it to heart, and acted with commendable discretion. First, it was necessary to summon the scientists, in order to learn the names of the fungi, their habits and the extent to which they were responsible for the troubles. They came. They came armed with the microscope, and presented long papers profusely illustrated with the details of strange forms, and described the behavior of mycelium and spores in bewildering intricacy. Probably no florists' society has ever been favored with more complete and admirable papers upon the diseases of its special kind of plants than the American Carnation Society listened to at its last annual meeting from Professors Atkinson and Halsted. The scientists have certainly responded cordially to assist in carrying out the first part of Mr. Falconer's suggestion.

Having ascertained what fungi cause diseases, it is now best to turn to the second part of Mr. Falconer's suggestion, and learn to recognize the different forms of disease, and to associate the right fungus with each. This is work for the florist, and it is to aid his efforts that this paper is presented.

We will suppose that something is wrong with the carnation bench. The plants do not flourish, or they have taken on a discolored or distorted appearance, how is the case to be diagnosed? There seems to be no indication of insect work, and so fungi are suspected. What next? The best plan would be to call an experienced specialist—a plant doctor—a practical vegetable pathologist—and accept his diagnosis. At present this is an unusual proceeding; but the time will doubtless come when it will be as common, and thought as sensible, a practice as to call a doctor for one's horses or one's children.

But to-day every man is his own doctor, so far as his plants are concerned. He must diagnose the case and prescribe the remedy. If he possesses a microscope of fairly good quality and some skill in its use, the way is clear: Look at the plants, then at the learned accounts of pathogenic fungi; put a little of the material suspected to be a fungus under the microscope, and compare it with illustrations of spores and mycelium outgrowths. It will not be difficult, as a rule, to decide which, if any, of the fungi described are present in the case in hand. Usually, however, no microscope is available, can anything be done without it? Yes, very much, often all that is required. For this purpose a small magnifier, costing from 50 cents to $1.50, is of much aid. There are less than a half dozen well marked diseases caused by fungi, and the first thing to do is to decide in reference to these.

Rust is the most dreaded, and fortunately the most clearly defined, of all carnation maladies. It appears in spots on the leaves and stems from the size of a pinhead to a quarter of an inch across. The larger spots are irregular in shape, being made up of the small ones standing close together. For a while there is a thin covering, and the spot looks like a blister. When the blister breaks, as it soon does of itself, or can be easily broken by the finger, it is seen to be filled with "a fine snuff-like dust" that readily rubs off and scatters the infection. The most characteristic thing about rust is this brown powder. Any spots or discolorations of any sort, which do not yield the powder are not rust.

Spot is the next most important disease at present attacking carnations. It can be recognized with much certainty. Definite roundish spots are formed upon the leaf, often as broad as the full width of the leaf. A spot shows almost equally well upon both surfaces of a leaf, the tissues of the leaf being practically dead. The spots are pale yellowish or a whitish color, with the living tissues around the leaf more or less deeply tinged purple or red, thus forming a kind of halo of color shading off into the healthy green of the leaf. The pale center of the spots, an eighth of an inch or more across, is eventually (that is, if the spots are not too young) thickly studded with small black points. The dots may occur on both surfaces of the spots, but usually are more conspicuous on one surface than on the reverse. Holding the leaf to the light and looking through it, often aids materially in detecting the dots. Nothing is so characteristic of this spot disease as these black dots scattered over a definite pale area. The dots are really inside the leaf, so that throwing the light through the leaf will often reveal them better than in any other manner. There are usually several hundred dots in each area. Spot occurs on the stems, as well as on the leaves, where it shows the same characteristics, although not always so well defined.

The next most prevalent and distinct disease is what has been called *anthracnose* (an inappropriate name, it seems to me, which needs to be replaced by a better one). This is most conspicuous and destructive upon cuttings, although it also sometimes seriously affects plants in flower, when it is usually most conspicuous on the bases of the older leaves, and at the joints of the stem, particularly if shaded and kept moist. The fungus (*Volutella* sp.) shows as small dots, very black, of unequal sizes, scattered profusely over the pale, bleached surface of the plant, without any definite limits. The dots stand out well beyond the surface of the plant, and if examined with a hand magnifier, many of them can be seen to be made up of tufts of minute black bristles. The well raised black dots, formed of minute black bristles, are the characteristic features of this disease. Without seeing the minute bristles under a hand lens, it is sometimes difficult to separate this fungus from a brown or blackish fungus (*Cladosporium*) that sometimes attacks weak or poorly grown plants.

The Cladosporium spreads over the dying or dead parts of the plant, or even attacks the young growing parts. The surface turns brown or blackish, and slightly velvety, in irregular patches of indefinite extent. It never forms well defined dots or well limited areas. There is another more conspicuous mold (*Botrytis*), which sometimes makes its appearance upon dead parts of the plant in a moist greenhouse, which I need not mention further, as it also occurs upon any dead plants under the same conditions.

Fairy-ring is a well marked disease, not yet widely distributed, which can doubtless be fully controlled, if intelligently handled. The fungus (*Heterosporium echinulatum* B. C.) gives rise to roundish, fairly well marked spots upon the leaves, which at first remind one of those formed by spot (*Septoria*). But the fairy-ring fungus does not cover the areas over with black dots but with concentric rings, which are minutely velvety and black, or nearly so. These fungus-infested areas show upon both sides of the leaf.

The bacterial disease of carnations, which for convenience we may call bacteriosis, shows readily upon leaves recently attacked. It at first forms translucent dots in otherwise healthy leaves, best recognized when of the size of a pin point by holding the leaf so that the light will shine through it. These dots enlarge and run together, and the leaf finally turns yellow and dries up. The presence of the disease can be recognized by looking at the leaf with light shining through it long before any indication appears upon the surface of the leaf.

Rosette and *purple joint* are two obscure diseases not yet sufficiently studied to make it possible to include them in this summary. This ends the list of fungous diseases of the carnation now known.

Of these several diseases, rust, spot, fairy-ring, and bacteriosis form in their earlier stages definite spots of a characteristic appearance, which can be recognized with much certainty without the use of a microscope. Each of these four after a time causes the leaves to turn yellow and gradually die. It is not until the later stages are reached, as a rule, that the disease attracts attention. In diagnosing a disease the novice often makes the mistake of trying to determine the cause by examining the plants that are already dead, instead of looking at such as are yet in the earlier or intermediate stages. In the earlier stages one may expect to find only the fungus causing the disorder, or at least to find it predominating, while afterward various molds and rots dispute possession of the dying or dead plant, and obscure or quite obliterate the original fungus.

The first step in such an examination is to determine whether any one of the fungi named, or any similar fungus, is present or not. If there is any doubt about the identity of the fungus, send a liberal sample, either dried, or packed in such a way that it cannot mold, to some botanist for determination. The list is a short one, and the writer believes that every florist could soon learn to recognize the several sorts with much certainty even without the aid of any magnifier, although an inexpensive hand magnifier, will be of much service.

But no method of identifying these diseases is equal to a personal knowledge of their appearance under varying conditions. To have a good description at hand is a help, but I cannot feel the same confidence in this aid that Mr. Alex. McBride expresses in the AMERICAN FLORIST (1893, p. 930). He says, there should be "a lucid description of the exact manifestations of each of these diseases, divested of all technicalities, and omitting all results of microscopical observations, but describing in detail the peculiarities of each as they appear to the unaided eye. It should be so clear that every grower of carnations would be enabled to detect at a glance the presence of any one of these fell destroyers." Now even a trained botanist does not depend upon descriptions for identifying either fungous or flowering plants, when it is possible for him to get authentic specimens to compare with. Any one of you would find it difficult to describe a man so that provided only with the description the rest of us could identify the person whenever we came across him. How much more difficult is it to identify these minute fungous growths, with which we have so little acquaintance. Descriptions are desirable, and the man that can make the best should receive due credit; but are there not other valuable aids that can be made use of?

In this connection I desire to make a suggestion. This society brings together at its annual meetings a display of blooms for examination and comparison. Let it also institute a display of diseased specimens. Each member could bring such material as may be convenient, both to show to others who may not know the diseases, and also in many instances to satisfy himself that his own diagnosis has been correct. It would be well, in order to make sure that all the diseases are well represented, for the secretary or some duly appointed person to ascertain in advance who is willing to contribute at each forthcoming meeting fresh authentic material of each disease for comparison. I am aware that no grower wishes to admit that his plants ever show any form of disease whatever, and so I suggest that all diseased specimens be obtained from kindly disposed neighbors, who do not make a specialty of carnations, and do not feel their reputations to be in danger. As this society usually has a botanist at its meetings, he could be invited to come armed with a microscope and be in readiness to determine doubtful cases.

This suggestion is an adaptation of the method long in practice in England for becoming acquainted with edible and other mushrooms. Each season a meeting is held at which the members spend part of the time in scouring the woodlands and meadows for mushrooms and the rest of the time in comparing the material collected and in personal examination of specimens named by competent botanists who are present. Thus each member secures an accurate working knowledge of mushrooms. If a method of display could be adopted by this society and heartily carried out, I predict that the advance in general practical knowledge of fungous diseases, and of their treatment which could not help but follow, would be as astonishing as it would be gratifying.

In the discussion which followed Sec'y Pennock asked Prof. Arthur if he could not suggest a substitute for the word anthracnose, objection to which was noted in the essay. Prof. Arthur replied that while the name anthracnose as applied to diseases of other plants conveyed a description quite foreign to that of the carnation rust still he had been unable to think of a satisfactory substitute.

Mr. Ward exhibited a small pocket microscope, costing $1.50 to $2.50, and said it would be found a valuable aid by carnation growers in discovering evidence of disease on plants. He felt that great injury had been done through the unwillingness of growers to admit that they had the rust on their places. This, in his opinion, had caused great injury to the carnation industry, as the rust had thereby been widely disseminated when its distribution could have been avoided had growers recognized the evil at once, and instead of hiding it taken steps to at once eradicate it root and branch. Last year he had no rust but was unable to claim that for his stock now. It came to him on stock which he had taken to grow for another party. He felt that a number of growers had denied having rust when they did have it, simply because they did not recognize the pest when it appeared, and that education of all growers to be able to readily recognize it was extremely desirable.

Mr. Lonsdale had been wrestling with the rust problem for several years and found that plants kept under glass all summer and continually treated with the various fungicides were now practically free from the rust. He had always failed in his efforts to grow Buttercup well until

last year. Not that it rusted, but he did not seem to be able to keep it healthy otherwise. He kept the plants under glass all summer and had met with his first success in growing this variety.

Mr. Ward again spoke, and said he believed the rust was very apt to follow any check given the plant, the most severe check as a general thing being when the plant was lifted from the field and the avoidance of this check may have contributed to Mr. Lousdale's success. He said the disease usually is first visible in the shape of a small pimple at the base of the leaf, and that owing to its being in a measure hidden from observation in this position the disease was very apt to have made considerable progress through a house of plants before the grower noticed anything wrong.

Mr. Michel asked Prof. Arthur whether the best plan would not be to apply liquid fungicides in moderate strengths as a preventive rather than wait till the disease had developed and then attempt to cure.

Prof. Arthur replied that you cannot kill the disease after the plants are once infected. The fungus grows inside of the plant and the only external evidence of its presence is the spores breaking through the skin of the leaf after the fungus has reached the fruiting stage. But through the application of fungicides the *spores* may be killed and the *spread* of the disease thus stopped. He had seen plants that were literally blue from applications of the Bordeaux mixture but in which the rust still grew. Still it could not spread any further as the spores were killed when they came to the surface and thus further dissemination of the pest was prevented. He would recommend that the Bordeaux mixture, in about half strength, be syringed over the plants once in every one or two weeks. Once a month would be too infrequent to be thoroughly efficacious. The "Fairy ring" disease has been very destructive to carnations in England, often cleaning a house out entirely in spite of all efforts to check it. It may not be so destructive here in this climate, but as it has been imported into this country it would be well to keep a sharp look out for it and to prevent its spread if possible, for it might prove to be as destructive as rust.

Mr. Ward believed that prevention was the plan to adopt. He keeps the atmosphere of his houses continually charged with fungicides. He found fostite very useful for this purpose. It is a very fine powder and the atmosphere can be so filled with it that every part of the plant is sure to be reached as well as under the benches, in crevices, etc. where spores may have lodged. One objection to fungicides as a preventive was that they injure the flowers, rendering them dirty and frequently unsalable.

Prof. Arthur called upon Mr. Dorner to describe his method of prevention which he said had resulted in making Mr. Dorner's houses an exceedingly unprofitable field in which to hunt for specimens of diseases. Mr. Dorner replied that he dissolved one pound of sulphate of copper in two quarts of ammonia, in a 2-gallon jar. When dissolved he adds another quart of ammonia and stirs it up well. He finds this makes the solution clear and avoids the curdy condition that results unless the later addition of ammonia is made. The liquid can be kept in this form for some time. A pint of this solution is added to a barrel of water and with this the plants are syringed with a force pump every two weeks.

Prof. Arthur added that while many things regarding fungicides remained to be determined by further investigation it has been thoroughly proved that the copper compounds were poison to the fungi. It kills the spores at the moment they begin to germinate. He believed that the spot and bacterial diseases were not a serious menace unless allowed to spread freely, but that the rust and the fairy ring disease would be apt to exterminate the carnation if not kept under sharp control.

On motion of Sec'y Pennock a committee of three, consisting of Messrs. Ward, Lonsdale and Shelmire, was appointed to formulate a plan to bring together at the next annual meeting a collections of specimens of the various carnation diseases in accordance with the suggestion in Prof. Arthur's essay.

Discussion of the President's address was then taken up, the main discussion being upon the advisability of attempting an exhibition as outlined in the address.

Mr. Dorner was heartily in favor of such an exhibition and thought the display should be a competitive one. Mr. Shelmire was decidedly in favor of the exhibition and felt that it would greatly benefit the trade, particularly in the city in which it was held. Mr. Dorner advocated securing an airy hall with abundant ventilation. He believed that a small hall crowded with people put flowers to sleep very quickly. Mr. Hill being called on enlarged upon the great benefit to the trade of all exhibitions and of the proposed one to carnation growers. He offered all the assistance in his power, financial and otherwise, to make it a success. Mr. Gillett cited the education of the people from exhibitions and noted the fact that retail buyers now called for carnations by name. Mr. J. G. Hancock was warmly in favor of the exhibition. Mr. Hill suggested that an arrangement might be made with the local club where convention was held to give such an exhibition jointly with the Carnation Society. Mr. Grant stated that the several Chicago florists present had each mentioned the exhibition as the attraction that took them to the convention, and that others who had been unable to come had said they disliked to miss the opportunity to see the display of new varieties. He judged from this that the exhibition feature was one that it would be well for the society to elaborate. He believed that an excellent feature of the exhibitions would be a display of arrangements of carnations, showing the many profitable uses to which carnations could be put in the work of the retail florist.

Mr. Hill thought that pot plants of carnations should be made a feature, and mentioned the grand display he had seen at an English show.

Mr. C. H. Allen said he had seen pot plants of Wm. Scott, grown by Mr. Ward, with 10 to 12 blooms, that would make a great attraction at an exhibition. In the English garden varieties the one called Winter Cheer would be exceedingly useful for an exhibition held in winter. He had found it a splendid pot plant. The color is much like that of Garfield. The plant grows right through the winter, and blooms through the summer too.

On motion of Mr. Michel a committee of three, consisting of Messrs. Allen, Dorner and Witterstaetter, was appointed to prepare a plan of giving an exhibition as suggested by the President and to report the following day.

The committee on awards being called upon for a report announced that they had awarded the Chester County Carnation Society's gold medal for best seedling to Mr. Fred Dorner's "The Stuart," and asked further time to report other awards.

The Exhibition.

This was a grand feature, Mr. Fred Dorner's display being alone an exhibition it itself. He had a 40-foot table completely filled with vases of magnificant blooms. Prominent among these were beautiful vases of Wm. Scott, Uncle John, Mrs. E. Reynolds, E. A. Wood, Goldfinch, Mme. Diaz Albertini, The Stuart, Richmond and Daybreak. In addition there was a host of seedlings. Among the most striking of these were No. 42, a very large white striped carmine; No. 77, a salmon yellow striped and flaked with carmine; No. 78 much like above with a slight difference in markings; No. 69, much resembling Wm. Scott; No. 71, an excellent white; No. 12, much like Albertini; No. 79, pink suffused with light salmon at base of petals; No. 23, fringed deep pink; No. 16, a shade darker than Albertini; No. 44, light yellow with faint crimson pencillings; No. 54, color similar to Albertini but different in form; No. 29, white; unnumbered, heavy carmine pencillings on light ground, a very taking flower of unusual size; No. 14, a shade lighter than Reynolds; No. 50, a shade deeper than Albertini; No. 46, a shade lighter than Reynolds, good form and size; No. 41, an excellent crimson; No. 32, much like Albertini, petals curled more; No. 53, a shade lighter than Reynolds; No. 84, a violet shade, a new break; No. 98, a huge white; No. 75, a fine large pink; and 15 or 20 others, none of them without merit. It was truly an educational display.

Other exhibitors are listed in the following report of committee on awards.

THE GOLD MEDAL.

We award the Gold Medal of the Chester County Carnation Society to The Stuart, exhibited by Fred Dorner & Son, Lafayette, Indiana.

CERTIFICATES.

We award certificates of merit as follows:—To Uncle John, exhibited by Fred Dorner & Son. To Helen Keller, exhibited by Edwin Lonsdale, of Chestnut Hill, Philadelphia. To Jubilee, exhibited by E. G. Hill & Co., Richmond, Indiana. To Fred Dorner & Son for display of new seedling carnations. To Bertermann Bros. Indianapolis, Ind., for Edna Craig. To W. W. Coles, of Kokomo, Ind., for vase of Kaiserin Augusta Victoria rose.

Fred Dorner & Son have the finest display ever exhibited by any one grower; special mention should be made of Richmond, William Scott, E. A. Wood, Goldfinch, Mme. Diaz Albertini, Uncle John, The Stuart. They also exhibited a number of new seedlings never before shown. Among these were variegated seedling No. 42, measuring 3½ inches; No. 75 measuring 4½ inches, excellent carmine pink; No. 46 deep rosy pink measuring 3 inches; No. 41 crimson, of good size; No. 98, 3½ inches, white, remarkably double and finely fringed.

R. Witterstaetter, Cincinnati, Ohio, very creditable display of about twelve varieties, including a vase of excellent Buttercup and Daybreak, worthy of mention for color and size. Seedling No. 50 a very promising scarlet.

Peter Herb, Mt. Healthy, Ohio, Adelaide Kresken; it is a very large and fine flower.

Edward Swayne, Kennett Square, Penn. vase of Ophelia and Sweetbrier.

Edwin Lonsdale, Chestnut Hill, Penn., vase of Helen Keller, the finest variegated carnation now on the market.

CARNATION BOUTON D' OR.

Weishaar Bros., Beech Grove, Ind., three novelties—Gertrude, Bessie and Hilda.

Heim Bros., Blue Island, Ill., several vases of standard varieties.

Henry Michel, Marion, Ind., displayed his new white seedling with remarkable fragrance, also several other varieties of seedlings.

Bertermann Bros., Indianapolis, Ind., general display, a remarkably fine vase of Fred Dorner and Edna Craig.

George Hancock & Son, Grand Haven, Mich., displayed a number of standard varieties.

W. R. Shelmire, Avondale, Penn., displayed a number of Cæsar's seedlings.

Adolph Pahud, Indianapolis, Ind., displayed a vase of standard sorts and a new scarlet, W. W. Coles.

J. M. Gasser, Cleveland, Ohio, a display of standard varieties.

E. G. Hill, Richmond, Ind., a vase of The Stuart, Mme. Diaz Albertini and Daybreak which were very fine.

John Hartje, Indianapolis, Ind., a promising white seedling.

ROSES, ETC.

E. G. Hill & Co., Richmond, Ind., Senator McNaughton (white). The flowers exhibited were not white and this variety cannot be classed as a white rose.

J. A. Peterson, Cincinnati, Ohio, displayed a vase of magnificent American Beauties.

Thomas Jackson, Cincinnati, Ohio, very fair display of Marie Louise violets.

A fine vase of Marechal Niel was displayed without any name attached.

W. W. Coles, Kokomo, Ind., displayed some magnificent Mme. Caroline Testout.

J. S. Stuart of Anderson, Ind., several vases of fine roses.

J. M. Gasser, Cleveland, Ohio, exhibited some excellent Bridesmaid, Hoste, Bride, Mermet, Watteville, Cusin and mignonette.

Pittsburg Clay Mfg. Co. displayed pots and cut flower vases.

B. Schroeter, Detroit, Mich., showed his wire plant support.

The Cottage Gardens, Queens, N. Y., exhibited a case of young plants.

Bertermann Bros., Indianapolis, Ind., fine specimen cinerarias and azaleas.

The general display was greatly enhanced by the Indianapolis Florists Club's exhibit of palms, &c.

At Wednesday morning's session Secretary Pennock read his report, which showed a present membership of 144. Treasurer Allen's report showed receipts during the year of $382.68, a balance on hand of $132.49, and total assets of $361.99.

Mr. Herr reported briefly for the nomenclature committee, and the committee was continued for another year. Mr. Ward reported for the committee appointed to carry out Prof. Arthur's suggestion about an exhibition of carnation diseases, and the committee was instructed to go ahead on the plan advanced. Boston was selected as the place for holding the next annual meeting.

The election of officers resulted as follows: President, Eugene Dailledouze, Flatbush, N. Y.; Vice-President, E. G. Gillett, Cincinnati; secretary, C. J. Pennock, Kennett Square, Pa.; Treasurer C. H. Allen, Floral Park, N. Y. Two proposed changes in the constitution were adopted, one inserting the word Canada so as to read "We, citizens of the United States and Canada," and one changing the time of meeting from the third Tuesday to the third Thursday of February. Considerable discussion developed over the adoption of a scale of points for judging carnation flowers, and the matter was finally referred to a committee to report at a later session. Mr. Fred Dorner's paper on "New carnations and their introduction into commerce" was then presented as follows:

New Carnations and Their Introduction Into Commerce.

BY F. DORNER.

New carnations and their introduction into commerce is a theme which occupies the minds of a great many florists of the present time. The progress and the improvements made in the divine flower have created a stir over the whole country, and much has been said and written about it. New thoughts and ideas chase the old modes and habits of their culture, as the new varieties are chasing the older ones from greenhouse and market. A great deal can be learned yet, and much can be said about such an interesting theme, but I will confine myself to a few views of this all absorbing phase in the culture of the carnation.

When one's occupation leads him daily through the same channels,—an occupation having its diversities in the change of the seasons of the year, an active and observing mind will notice a great many things which went by unobserved before. Thoughts flash through one's mind which under close dissection prove mere illusions. But sometimes there is a grain of truth worth the while to analyze and to bring into practical use. Now we are only too often led by our self love and importance to make pets of our creations, and we all know pets are very often horrible things in other people's eyes. We see all their good points, overlook their faults, and when, as with our new varieties of carnations, we cast them on the broad field of commerce, the majority make a sore struggle for life and go under never to be seen again. It is then our pets are shown to us with all their faults exposed. Faults which loving eyes, or perhaps greedy ones, were unable to see before. Now do you not agree with me that such conduct is wrong, and is often ridiculed to a large degree? Disappointment and reproof will be our reward, and a momentary gain will be charged to the debit of our reputation.

The grower of new carnations only too often falls into the error of idealizing his new varieties, especially when he grows only a small number of plants. All the best care is bestowed upon them; they never suffer anything to advance them in their growth. They are kept clean of decayed leaves, tied up nicely, so that they are always shown at their best. Well, in short, they are made pets. We should give our new varieties the same culture that all carnations require, and give them a thorough test for their adaptability as a market variety. Carnations are unlike chrysanthemums, where some varieties are grown for show purposes only. We want in a new carnation, a variety we can grow for a profit, pet flowers and pet plants should cut no figure in selecting a variety for dissemination.

I am still of the same opinion, that I expressed in my paper read before the S. A. F. at Toronto. Namely:—That carnations are more or less short lived, caused by their productiveness without sufficient intermission of rest. This is one reason why we find a ready market for good new varieties. However, our chief aim should be their improvement. In grow-

ing a large number of seedlings every year, I make it a rule not to form a decisive opinion on any seed plant. I merely make my selections of those I wish to put on trial the next year, and grow a sufficient number of plants for that purpose. These I give the same treatment, the same care, and the same exposure that I give all my other plants. If there is any good in a variety, any meritorious improvement, it has to show itself under the general culture, and should not be forced. True, we should know what special treatment to give any one variety but this cannot be learned in one or two seasons. If there is any possibility of improving their merits by a better understanding of their habits it will be much in their favor.

In this second year's growing, "the year of trial," an observant grower will notice many interesting features. Many varieties are going back already, showing unmistakable symptoms of decreasing vitality. In one plant we would not be sure whether or not a deficiency was caused by natural agents, but if we grow from 12 to 25 and 50 plants of a variety and all show the same symptoms, then there can be no mistake about it; and these are to be left alone, however promising the seedling plant may have been. This degeneration will be noticed in various ways:—In a less healthy growth, split flowers, where there was not one to be seen on the seed plant, weak stems, smaller flowers and less free blooming. The symptoms of degeneration are the same as in old standard varieties.

Other varieties will hold their own. But those showing a marked improvement in the requirements of a good carnation are the ones wherefrom to select the varieties for future use; and of these there will only be a small number from the big lot started from seed. An improvement over the seed plant I consider one of the most important points. It shows a vitality which is not fully developed, and may yet be improved in the hands of a careful cultivator. The other most essential points are:—strong healthy growth, strong stem, good form and clear distinct color of the flower, and freedom of blooming from early to late, for if a variety shall prove remunerative we must also consider quantity as well as quality.

If these qualities can be found on the trial bench, one may safely make selections for introduction into commerce. I will dwell on this point farther on and will take a view of what we consider a good flower. Some would say ideal flowers, but this has too much relation to pets, as the different person's ideals differ very materially. In regard to form we will soon have to take a broader view than we have been taking. Some growers have expressed their idea, and describe very minutely how a good flower should be formed. In one point we all agree that is, that the calyx shall not be bursting. How the petals are formed and arranged is a matter of taste as much so as the color of the flower. I think we will soon term our carnations as we do chrysanthemums. We will have our incurves and reflexes, as well as flowers with straight petals; flowers symmetrically built like a Chinese or curled and twisted like a Japanese. To make a comparison with the rose we will have our American Beauties and Belles, but this all will be governed by the taste of the consumer and with what remuneration a variety can be grown. I should like to make a few remarks for illustration. I hesitated to send out our variety Wm. Scott, on account of its irregular and often twisted flower, and only for its free blooming and vigorous growth did I put it on the list. From its first appearance it found favor everywhere and is now considered one of the best. Mrs. Reynolds found less favor on account of its tendency to incurve its large broad petals. It is said, this is too suggestive of going to sleep, although I have kept flowers in this incurved state for over a week. As to color Dame Fashion is absolute ruler. Any color if decided and brilliant is good. It will find its admirers and will be sure to have its day when finding favor in the eyes of Dame Fashion. Undecided shades, striped and mottled flowers are not so much recognized, but still have their admirers. The value of the improvements made in the last 4 or 5 years cannot be overestimated. The way our work is appreciated is shown by the ready sales of good flowers at good prices. This encouragement should stimulate us to make further efforts in their improvement.

The introduction of new varieties is a topic of much discussion. A great deal of dissatisfaction is experienced by seller and buyer. Various ways have been suggested to test the merits of a variety before it is thrown on the public, to save the purchaser from buying worthless stuff. A suggestion was once offered, "To appoint Experimental Stations, noted growers in different parts of the country to try their adaption to locality as well as to test their merits of the originator's description." But what will all these measures avail in a large country like ours? Can we restrict the usages and liberties of trade as long as there is no physical or moral harm done by the article in question? Can the American Carnation Society compell a grower to observe their rules? No, not even can the Society compel its own members; for if the membership becomes a fetter to his ideas he will simply leave it. Our society is not a society for amusement, it treats of our occupation, and any wrong supposed or real on one side with dollars on the other will soon decide which way to go.

The only available measure of any importance, to separate the chaff from the grain, of the many seedlings now grown everywhere, has already been taken by the society at our last meeting at Pittsburg, with the resolution adopted:—Not to recognize any seedling, for any award of any kind, unless it is in the third year's blooming. This measure will at least force the grower of new varieties to give them a more thorough trial if he values any of the American Carnation Society's awards. The American Carnation Society has accomplished a great deal in the short time of its existence, and should command the respect of every florist. Any award given by this body should be prized as the highest honor that can be bestowed on a new variety. If the society would arrange for a Carnation Exhibition at a suitable time in the year much more good could be accomplished. As a Society we can only compliment the good and denounce the worthless.

This leads to the conclusion that every grower must be his own judge. And in fact no grower can depend on a new variety unless he has made a trial for himself, for we must deal with a factor that cannot be over looked. "The adaptability of a variety to the locality, and would like to say, to the mode of culture he practices." How often we hear that certain varieties grown in the East will not do well in the West and vice versa. Still more; it is often reported that in a radius of 50 miles, one variety does better in one locality than another. How often you read reports in the AMERICAN FLORIST or the *Florist's Exchange*, that one grower has one variety to perfection while another variety looks poor, and with his next neighbor he finds the reverse. What would Experimental Stations amount to in the face of such facts. I repeat it again every grower must experiment for himself and grow that which will do best with him. He is not expected to try every new variety he sees advertised, but to select what may suit his wants or may prove a betterment over what he is growing, and give them a test on his place. It is unjust for one to condemn a variety he cannot grow with profit, while another can. The grower of a new variety if honest in his convictions can not be blamed when it turns out a failure at other places. Sometimes the introducer of a new variety is accused of propagating the life out of a variety in quest of filling all his orders from a small number of plants. Such an accusation may sometimes be true, but on the other hand the buyer sometimes follows this same example and keeps on propagating from the young weakened plants, and makes two and three out of one. The question of this kind of practice can be answered with the adage "as we sow we reap."

Like all new articles our new carnations have to run the gauntlet of taste and criticism of the grower and consumer. If tasteful to the consumer and remunerative to the grower it is a go. Many new varieties have been introduced into commerce in late years, a great many will follow in the future. Old varieties will be laid aside like a wornout, threadbare garment and replaced with a new one. Other new varieties will find their way into commerce on account of their superiority over existing varieties. The same law that rules commerce will answer here, the good will survive, the worthless will go under. Business tricks may help for a time, but honesty will prevail.

The essay was received with applause and a vote of thanks to the essayist was unanimously passed. In the discussion that followed Mr. Lonsdale asked Mr. Dorner about the cause of the bursting of the calyx. He had grown seedlings that seemed remarkably promising the first year, but which the second year or third year would develop such a tendency to burst that they were worthless. Mr. Dorner replied that he had had the same experience with numerous seedlings. He believed the fault was an early indication that the variety would run out. Mr. Hill indorsed what Mr. Dorner had said and cited similar cases from his own experience. Mr. Witterstaetter had noted that even when the first flowers on seedlings came perfect the second crop of flowers on some plants were apt to burst. Mr. Dorner said the greatest tendency to split was to be seen in varieties having short round calyces, and that flowers having long slender calyces were most promising. In the latter the petals elongate the claw and grow out over the top of the calyx without bursting. Referring to the length of life of varieties Mr. Lonsdale said that Buttercup, which had been in commerce twenty years, had done better with him this year than ever before. Mr. Dorner replied that of course there were exceptions to all rules. Regarding Hinze's White Mr. Dorner thought that the rest this variety takes between crops had been of great assistance in lengthening its life,

as against others which were exhausted by continued growth and bloom. Mr. Allen added that there was no money in varieties that did not bloom continuously and that croppers should be dropped. The morning session then adjourned.

At the Wednesday afternoon session the first business was the report of the committee on exhibition, who recommended that the officers of the society act in conjunction with the Mass. Hort. Society in arranging for an exhibition during the Boston meeting, the American Carnation Society to guarantee premiums to the amount of $500 on carnations, and to appoint two of three judges, the remaining one to be selected by the Mass. Society. Also that premiums be offered for pot plants and that exhibitors who were not members of the American Carnation Society be charged an entrance fee of $2. To insure the guarantee some twenty or more gentlemen subscribed $25 each and a committee was appointed to solicit further subscriptions.

The committee on adoption of a scale of points for judging flowers reported the following, which was adopted:

Form	20	points
Fragrance	10	"
Size	20	"
Color	20	"
Calyx	10	"
Stem	20	"
	100	"

The committee recommends that no medal, certificates or other prize be awarded unless the variety has been bloomed for at least three seasons. Also that judges consider the points from the commercial standpoint rather than their exhibition value.

A committee was appointed to design and have printed a form for the society's certificate of merit.

Mr. Eugene Dailledouze then read his paper on "Carnations for cut flowers," given in full below.

Carnations for Cut Flowers.

BY EUGENE DAILLEDOUZE.

MR. PRESIDENT, LADIES AND GENTLEMEN:—Before reading the few notes I have prepared on the subject "Carnations for cut flowers," I will make a few remarks on the early varieties, or the real beginning of the culture of the divine flower in this country, to any extent.

The first white was, so far as I can learn, Mount Blanc. It was imported into this country in the fifties. The flower was very large and shapely; possibly as good as has been seen up to this date; but the plant was a very tall grower and shy bloomer. Prior to this time there were only a few varieties in cultivation, among them a bright red, a variegated and two or three others. They had all the same failing, being shy bloomers and very tall growers. Unfortunately, I have not been enabled to learn the name of the varieties.

In 1858 came another importation, this time in the right direction. It was the famous La Purite from Lyons, France, and its arrival is still fresh in the memory of a few old florists. In the same lot was De Fountaine, probably the first of the yellow class.

In the spring of 1862 some seed was imported from the amateur and specialist who raised the two last named varieties. From the seed quite a lot of plants were raised and bloomed in the fall of the same year. Among these were President De Graw, which was not considered of much value, but was, however, kept for another trial, as it showed a tendency to bloom freely. Flatbush, another variety, was considered the pick of the lot; and I am told it was the finest white carnation ever seen up to the present day; but its life was of short duration, as it split badly and would not root. General Grant, another white, was thought much of, but it, also, failed to stand the test long. In 1864 President De Graw outshone all the others and was the standard white variety for many years.

In the spring of 1864 (March) plants of President De Graw and Flatbush were offered for sale; the first fifty were sold to Peter Henderson, in five inch pots, at $3 each. This was considered quite a start. In 1865 a catalogue was issued by Dailledouze, Zeller & Gard, containing 125 varieties. This firm introduced La Purite and De Fountaine in this country, and also raised and disseminated President De Graw, Flatbush and many other varieties, several of which would be appreciated to-day.

CARNATIONS FOR CUT FLOWERS.

The first point we have to consider is to start with good, strong, healthy cuttings; root them where you will—in a north, south, east or west house—so long as you accomplish the task. I prefer a north house, because, when they are once inserted in the sand and thoroughly watered they require little attention, except a light sprinkling and air when the weather will permit. Air should be given on all possible occasions, as it keeps the house sweet and dries up the condensed moisture, which is bound to form in a north house.

I find it makes no difference whether or not I use a knife in cutting. As to the proper time to make cuttings, I should say it depends altogether on your stock; that is, when it is in the best condition—any time from November until May for winter blooming. After the cuttings are rooted I prefer planting them in shallow boxes, two and a half inches deep, with plenty of drainage. Keep close for a few days, then gradually harden them off. The cooler you can keep them, without freezing, the better; plenty of light and air is very essential.

In our locality we generally plant about the middle of April, providing the ground is in condition and the weather will permit. I believe the earlier this work is done the better. We always plant in freshly ploughed ground, and we never allow it to be turned over a night before planting. We keep as close to the plough as possible, and find it quite an advantage. Plants take hold in fresh ground very quickly. By keeping the weeds down, cultivating and topping, plants should be in good condition to house about the middle of September.

In the houses we plant altogether on benches, four inches deep, and we find this method suits us best. We gave up solid beds some four years ago. We do not like to lift plants too far forward in bud, as it checks them severely and is sure to tell for a long time afterward.

We find the crimson varieties hardest to move. Great attention should be paid these; they should be topped back about two weeks before lifting, as it helps them materially. A little shading will also help them. We have had no trouble with the other varieties we grow. Keep them close and well sprinkled for a few days, then air gradually.

FIRING.

This should be done early, or as soon as the nights become damp and chilly, even though you have to keep on a little air to reduce the temperature. It is at this period that most of the diseases are contracted.

WATERING.

This important part will depend on the composition of your soil. We ourselves have a very heavy loam, with considerable clay, and find that we can water only when the beds are quite dry. We then give them a thorough soaking, which will last one and sometimes two weeks, according to the weather (this is for the winter months). Syringing we do not find necessary during December and January, except in houses facing the south, as they require more airing. They will be benefitted by syringing on all very fine days, being sure the plants will dry before night. In houses with full southern exposure the culture of carnations differs much from that in dull, dark houses, partly shaded from morning or afternoon sun.

I prefer 50° for a night temperature as a minimum, raising it a little higher on warm nights and reducing it slightly on cold nights. For the daytime I start to air it at 55°, weather permitting, and allow the temperature to rise to about 75° by noon. This must be understood to be sun heat, not fire heat.

VARIETIES.

Last, but not least, come varieties. In white, with us, up to last winter, nothing could compare for profit with Silver Spray. Now, however, we have to look farther, and we have substituted Lizzie McGowan, which is recognized as the standard white of to-day. I believe there is room for improvement on this good variety; the flowers are not always of as good a form as I should like, at least in our locality. We have had very good success with Puritan, and must say that if it would bloom a little more freely we would prefer it to Lizzie McGowan, as the flowers are much better shaped. Mrs. Fisher will not do well in our locality, although we hear flattering accounts of it in other sections.

Pink.—This class has a very broad scope. I believe that Grace Wilder, which has stood the test against all later comers for many years, will have to succumb; but which of the varieties will be the standard pink is yet hard to tell. Of the thoroughly tested varieties Daybreak is the universal favorite, as it properly should be, though I do not consider this in direct competition with pinks of the Wilder color. We have had many introductions the past year or two, and quite a few look well. We should be able to select one or more varieties to fill the bill.

Red.—I have not been able to produce, as yet, a variety to satisfy me in this color. Portia stands first with me as a tested variety to date.

Carmine.—In this color I find Tidal Wave still in the lead, though it does not succeed in all localities. For me it has more good points than any other carnation on the market.

Crimson.—I find Ferdinand Mangold about the best, with some bad faults. Crimson Coronet has a good color, and is the best keeper in its class, though the flower is rather small.

Variegated.—J. J. Harrison, as a tested variety, easily leads. With me its greatest fault is an inclination to burst, but we are promised something better in this class in the near future.

Yellow.—This class, though beautiful, has not been satisfactory to most grow-

ers. Buttercup is fine, but does not pay. Golden Gate is not good enough, and the other yellows we have tried are not satisfactory, with the exception of Bouton d'Or, which has many good points, and, I believe, will be grown for profit. Much more could be said, but I fear I have over-taxed your patience. I thank you for your kind attention.

In the discussion which followed Mr. Coles asked as to the value of the plan of keeping plants under glass all summer instead of planting in field. Mr. Dailledouze replied that he had had no experience except with Buttercup. Mr. Allen had tried the plan but didn't want any further experience. He found that when grown under glass during the summer the plants did not bloom as early and did not have the strength and vigor of plants that had been bedded out. Mr. Dorner had also tried the plan and agreed with Mr. Allen. Mr. Witterstaetter told of the experience of Mr. Peter Herb which had been more satisfactory, but Mr. Herb had removed the glass from his houses during the most of the summer months. Plants kept on the benches grew larger but did not produce as freely as those which had been bedded. Still the quality of the flowers was superior and the stem was longer and stronger.

Mr. Witterstatter then read his essay as below.

Desirable Varieties of Carnations and How They May be Improved.

BY R. WITTERSTAETTER.

In preparing this paper on "Desirable varieties of carnations and how they may be improved" I shall only class as desirable those varieties that are early, prolific and constant bloomers. A desirable variety should possess most of the following points of merit: A constitution that is not so easily affected by the disease termed carnation rust. It should be an early constant bloomer, with long stiff stem and non-splitting calyx. The flowers should be of good size, form and substance. They should open well in the short days of winter, and the petals should not come crimped. The flower, when brought to perfection, should be full and high in the center, so as to show as little of pollen as possible. In my judgment any carnation showing the pollen in quantity is as objectionable as the chrysanthemum with an open center. This is not so noticeable in the yellow and white varieties as in the darker ones, but I consider it an imperfection nevertheless.

I have heard it remarked time and again that we have plenty of good white varieties. We have quite a number that are good in their way, but none of them give entire satisfaction. Silver Spray I have found most satisfactory, but this variety is liable to disease and undesirable on this account. Lamborn is a very good white, but fails to open well in the winter months. Wm. Swayne is only desirable when short stem flowers are wanted. Lizzie McGowan does well until winter, when it comes imperfect, petals reflex and calyx bursts. Hinze's White and Puritan have always proved too late to be profitable. Mrs. Fisher is not good as a winter bloomer, coming pink and weak stemmed, but as a summer bloomer I consider it the best white. From what I have seen of the new white carnation, Uncle John, I am inclined to believe it a desirable variety and worthy of a trial.

In light pinks we are more fortunate. I consider Daybreak by far the best and give it first place. Although not as free a bloomer as it might be it has always given satisfactory returns in comparison with other varieties. Edna Craig is of good form and color when grown to perfection. This variety grew strong and healthy in the field, and for a time after being housed it did very well, producing flowers of good color. When the winter set in, however, the blooms came off colored. Edna Craig is undoubtedly desirable under favorable conditions, and most likely requires entirely different treatment. Wm. Scott is much better in this respect and will be grown in place of Wilder when it becomes better known. The only objection to it is the superfluous wood all along the stem. Especially is this the case where staking has been neglected. Of the deeper colored pink Tidal Wave takes the lead. I doubt if there is another variety that gives the average grower as much satisfaction as this one. It never fails to open, is always in bloom and has a constitution second to none. Its only fault is its short stem in the early fall. Another variety of this color is the new Adelaide Kresken. This is far superior to Tidal Wave, having very much larger flowers of a more pleasing shade, and stems much longer.

In scarlets the only desirable variety is Portia. We are waiting patiently for a larger flower possessing the same good qualities. In crimson none are very satisfactory to the grower who consigns his flowers, as all lose their brightness after being cut. Those who have a home trade think Anna Webb and Orient, in the order named, most desirable. Mrs. F. Mangold is not the bloomer that Anna Webb or Orient is, but has a much larger and better flower when coming, but it never fails to burst its calyx, however, in the winter months when the blooms are most valuable. With the variegated sorts I have had little experience, as the Cincinnati trade does not demand this class. I have tried Chester Pride, J. J. Harrison and Paxton, but found them shy bloomers in the fall and winter months. Our list of yellow varieties is very limited, and consequently we have few that come anywhere near being desirable. Buttercup ranks highest. Golden Gate is entirely too small. This, however, would not be an objection if it would not persist in splitting its calyx. Pride of Penhurst and Field of Gold are too late. They can not be brought in earlier than March. As a cut flower Golden Triumph is altogether out of the question. Why it was ever put on the market as such is more than I can imagine. There may be desirable varieties not mentioned in this paper, but having had no experience with them, and not having seen them growing, am unable to express an opinion in regard to them.

HOW MAY THESE VARIETIES BE IMPROVED?

I fear what I have to say will add but little light to that which is already known. Cuttings should be made from blooming wood, as they without doubt make the stockiest plants. Potting them is preferable to planting them in boxes, for the reason that when treated in this way plants receive no check until lifted in the fall. Another advantage is that planting can be deferred until later in the spring, when danger of cold and severe rains is over. I have found that cuttings treated in this way and planted out about the middle of May always make the strongest and healthiest plants. A further advantage in this treatment is that when you are ready to lift them you have a fine ball of thickly netted roots the size of the pot, and this will greatly help the plants to recover when inside. This may not be considered an advantage in sandy soils, but in clay it undoubtedly is. Probably you have had a bad case of rust on your place. It is in your power to prevent its occurrence to some extent by thorough and frequent cultivation in the field. What I mean by this is, you must keep the soil in a mellow condition. This can be done only by attending to it after every rain, no matter how light or frequent, always waiting, of course, until the soil is in condition to work. The idea is to be prepared for the drouth that comes upon us in July or August. Plants treated thus will be less liable to the attack of rust which is sure to follow with moist, cool nights to plants that have already suffered more or less during the trying ordeal. This is especially true with varieties which are more inclined to this disease, such as Silver Spray and others of like nature. To illustrate I will cite a case coming within my own observation and let you form your own judgment. The year Ben Hur was disseminated the plants were entirely free from disease. They were potted and after making large enough growth to allow the tops to be used as cuttings were topped, placed out in frames and then planted out in the field, doing very nicely. About the 22nd or 23d of June we had our last rain, which was very heavy. The soil was not in condition to be worked for eight or ten days after. We neglected hoeing until the soil became quite hard and dry. This left the plants in poor shape to withstand a drouth. Consequently they suffered greatly, and when the rain came and with it the cool, moist nights they fell an easy prey to the disease. The tops, when rooted, were potted in due time and planted out about two weeks before the rain. On account of being late in planting and small they were not neglected. They were hoed and mulched and watered once. These withstood the drouth remarkably well, and by fall made fine, healthy, little plants entirely free from rust. Experience has taught me that plants affected with rust had best never be housed, as I have always found it uphill work to free them entirely from the disease.

In housing the plants in fall I have always found that they do best in new soil. Judgment should be used in planting strong growing varieties far enough apart to allow them room to spread and not meet each other until January, as from this time on the conditions are not so favorable for the rust. Cultivation should be attended to. The soil should be kept in a mellow condition, but this should not be done before the plants are fairly well established. Ventilation should be left on night and day, even during nights when fires are necessary in early fall. Everything should be done to have the plants in as healthy condition as possible by December 1. Always attend to ventilation the moment the sun strikes your houses. Do not wait until the temperature is the required height, but begin at once, so that your rise will be as near nature as possible. Great care should be taken to have plants perfectly dry over night; they should never be watered overhead when there is danger of their remaining wet any length of time. This can only be done in early fall and late spring. All remedies as preventives of the rust can be used by spraying at this time, but when firing should be applied to the pipes. For this use sulphide of potassium, as sulphate of copper is liable

to ruin the pipes. I have always found cool, wet weather most favorable for the disease, and on all such occasions put on heat and open ventilators. I have found that by strictly adhering to these directions the health of the plant is improved and disease is less liable to attack them.

To improve on "desirable varieties" from seed, I have had but two years experience and perhaps what I have to say is mere theory. I have found that I can reproduce the color of Daybreak by using Silver Spray and Tidal Wave, using Silver Spray as the seed parent, but could not get anything near this color when crossing with W. F. Dreer. This cross produced more deep pink and purple, which goes to show that the result is entirely different, as far as color is concerned, when using the same seed parent, with different varieties of the same color, as the pollen parent. As to constitution it is not necessary that both varieties used in crossing should be rust-proof to produce a healthy constitution, as I found in the eight varieties which I saved for further trial from the cross of Silver Spray and Tidal Wave. Of these eight varieties three were subject to rust and the rest were free from it. They were all grown in the same house and no fungicide was used to prevent the disease. The blooming qualities take more after the pollen parent. This trait I have found in all the other crosses with the exception of one, namely, Tidal Wave with Fred Creighton. In this case the blooming quality took after its seed parent. Silver Spray seed always produces more or less purple varieties. Its own flowers being at times tinted with this shade I am inclined to think that it originated from some variety of this shade in an earlier generation. I think it is very important to know the ancestors of any variety on which we work, and by keeping a strict record of what different crosses bring forth, to learn how many come single, how many double, how many are of good form, how many are weak stemmed, how many strong, how many come with a strong constitution, how many with a weak one, and numerous other points, all of which it takes to make a desirable variety. We may by studying such records be able to bring to light the probabilities of producing the "ideal desirable variety" that shall possess the blooming qualities of a Silver Spray, the stem of a Daybreak, the form of a Buttercup, the constitution of a Portia and the size of a Malmaison.

Mr. Lonsdale asked the essayist if there were any varieties that could be considered rust proof. He replied that he had never seen any rust on Portia or Daybreak, and but very little on Buttercup. Mr. Ward had seen rust on both Portia and Daybreak but never on Buttercup. Mr. Lonsdale felt that no one could safely guarantee any variety as rust proof.

In the abscence of Mr. Walter Muston his essay on "Carnations in Canada" was read by Secretary Pennock.

Carnations in Canada.

BY WALTER MUSTON.

The carnations we grow in Canada are in the main the same as are grown in the United States; some kinds do well with us, some do fairly well and some do no good at all. The carnation that heads the list with us is Daybreak. Wherever we see it grown it is in fine shape; from the man that grows a hundred of it to the one who grows thousands of it the same is said of it. It has a fine constitution, is a vigorous grower, can be picked with good long stems and is always in demand; in fact it seems to be no respecter of places like most varieties, but grows well everywhere and in any soil. I hardly know which to place next on the list, some kinds doing better with some than others. Silver Spray used to be the stand-by for white, but it is acting badly now; its flowers come small and streaked and it is not the carnation it was a few years ago. Some grow Lizzie McGowan, but it does not seem to do well and the flowers do not have the symmetry that we look for in a carnation. A few grow Hinze's White (ourselves among the number); it perhaps does not give as many flowers as some of the other kinds because it is a cropper, but its blooms with us command as high a price as any of them and to a grower who has to sacrifice some plants to obtain room I think it will pay as well as any of them. White

EUGENE DAILLEDOUZE, PRESIDENT ELECT OF THE AMERICAN CARNATION SOCIETY.

Dove does fairly well with some growers and some complain of its being shy. In red we have Portia and Garfield, one kind doing best with some growers, and vice versa. These are the leading kinds that are grown. Tidal Wave is grown some and does well, but there is not a great demand for it. Puritan some think well of, but with us it has not acted well; its flowers do not open at all, but just dry up on the stems.

Among the new ones William Scott takes first place; it seems a vigorous grower, blooms freely and is healthy. Edna Craig is so badly diseased as to be practically useless; indeed out of about five hundred plants that I have seen there was only one plant that was healthy, and that had one flower on it at the time and it was a beauty. Mme. Albertini so far has been too shy. Buttercup we cannot grow at all; it has been tried repeatedly by all the principal growers around this district, but no one could do anything with it; we have tried it several times and have bought several different batches of cuttings, but they grow poorly outside and when taken into the greenhouse they would grow beautifully less and less until we had to throw them out and put something else in their place. Grace Wilder, which for years held the place in this country for pink, was nearly as bad; no one could grow it successfully. Its flowers would come streaked and the Canadian florists hailed the advent of the Daybreak with delight. Mrs. Carnegie used to be grown here a great deal, but has been dropped lately; it does not grow and bloom as it used to and like Spray it seems to be on the downward path. Its place is well filled by J. J. Harrison, which is grown by us all and is thought a great deal of. In crimsons we have none at all that are satisfactory, and they do not seem to be missed.

Our culture does not vary a great deal from yours. We strike the cuttings any time from January on; some growers plant them in flats at once and leave them there until they are planted in the field, some pot them first and then transfer to flats, and I think this latter is far the best plan; it takes up considerable more room, but I think it pays in the end, the advantages being that you get much finer plants to start with, your plants do not get pot bound, as they would if left in the pots, and do not strip when planted outside, and so do not get such a check as they would if they were left in the flats at the time and then badly stripped, as they generally are on account of the roots spreading so much. The advantage of this mode of treatment is especially seen if it happens to come dry weather directly after planting out and especially now that we have so much disease floating around ready to work on the plants at the least opportunity. Take a plant that is badly stripped when planted; it is small and has few roots and perhaps has lost some in being transferred from the flats to the field, the weather is dry and the plant has scarcely any moisture to feed upon and it is at a standstill; is not that a fine chance for any disease to ravage it? I think perhaps the potting of the plants is more important with us than with growers in the U. S., as our summer is shorter than yours, and we have to get as much growth in a shorter time. We do not plant out until the latter end of May, and we often get a spell of hot dry weather in the beginning of June, and for myself I like to water the plants a few times in such a case, as I think it helps to give them a good start and to make a vigorous growth, which is I think one of the best preventives against disease. There is one thing I think that we have in our favor and that is we nearly always get cool nights in the summer, no matter how hot the day, and this is claimed by some to be an advantage in our favor. The soil is kept cultivated and free from weeds and the plants pinched as every grower thinks best. As a rule we take hold of the end of the young growth and give it a sharp pull, which just takes out the center bud, but does not take away any growth. We lift in September; some growers prefer to lift with a ball of earth; some prefer to shake all the soil off them, but I think that is governed a great deal by the nature of the soil, some growers having a light soil which will not stay on the roots, but falls off, leaving all the fibrous roots intact. Our soil being a heavy clay, if we lift in a dry time, as generally recommended, we lose a great many roots, as the soil breaks up in large lumps, clinging to the roots with such tenacity that no matter how careful we are we are bound to lose a number of roots. I remember on one occasion starting to lift in the afternoon; the soil was quite dry and the plants stripped badly, but during the next night it rained and the plants lifted nicely the next day with a nice ball of earth, and the difference in favor of the plants lifted after the rain was quite noticeable all the season, and they were standing upright and had started to make nice roots some time before the others.

As we have no carnation specialists in Canada, they are grown in the largest quantities by men who grow roses and other cut flowers and they do not go to any particular trouble in procuring a

special soil, but grow them in the same soil as they do their roses unless it happens to be very heavy, and then they mix some sandy loam with it. I do not know of anyone that has tried old soil, neither have I seen anyone growing them in solid beds, they all seeming to prefer benches with about five inches of soil. We have the same diseases to contend with as you gentlemen have, but I think the worst is the rust, and from my own observation I find that while no varieties seem proof against it the least vigorous plants suffer the most. If any kind seems to be in a place or soil that is not suited to it and gets the rust it seems to spread more rapidly than it does on plants that are healthy and growing vigorously. Our treatment in the greenhouse is the same as yours and has been published in the different papers. In watering we prefer to let the soil get rather dry and then give them a good soaking. We do not syringe as a rule during December, January and February, although I have done so on all bright days, the same as roses, and did not notice any bad results from it, but that was in a three-quarter span greenhouse where the sun had every chance to dry the moisture up before night. In the raising of seedlings Canada has yet to be heard from, and as a number of men have taken that branch up I do not think it will be very long before there will be some Canadian seedlings on the market, as several have seedlings that promise something good.

President Hill then read Prof. Bailey's paper on "Border carnations."

Border Carnations.

BY PROF. L. H. BAILEY.

A year ago I urged upon this society the importance of encouraging the cultivation of the outdoor or border types of carnations, which have been an important feature of European gardens for centuries. I then called attention to the fact that only one of the several leading families of carnations is commonly known in this country—the winter or forcing types. It is a signal illustration of the fact that plants adapt themselves quickly to our own ideals, that the great development of our greenhouse gardening in recent years has resulted in a wonderful evolution of forcing varieties and in a corresponding poverty of border varieties; so that while the border varieties are the original stock from which all other types of carnations have come, and are still the most important family across the Atlantic, in this new country, with distinct ideals, the children have far outnumbered and even obscured the parent. These two great groups of carnations are opposed to each other in various attributes, but particularly, I think, in three. The border varieties are low or rather dwarf and tufted; they produce the greater part of their bloom in a comparatively short space of time; and the individual flowers need not be very large. The forcing type demands a very tall plant and it loses its habit of standing erect; the production of flowers is distributed over several months; and the individual flowers must be large. In short, in the one case, the ideal lies in the plant and its effect as a mass; in the other the only ideal is the individual flower.

I have insisted upon this antithesis in these two types of carnations in order to correct what I believe to be a wrong tendency in the attempt to popularize outdoor or border carnations in this country—the belief that the forcing varieties can be adapted to this purpose by propagating them in summer or fall and thus changing their season of bloom. It is true that the forcing kinds will grow and flower well under this treatment, but they are not the type of plant which is adapted to the requirements of out-of-door ornamentation. For this purpose we need a plant which needs no staking, which will give a definite and emphatic season of bloom by means of which strong effects can be produced; and the size of individual blooms can safely be sacrificed to productiveness and habit of plant. It is obviously unwise to attempt to impress forcing varieties into service in the open, and it would be a loss of time and effort to endeavor to breed adaptive varieties from them. We should begin, as a foundation, with the best existing border varieties, and endeavor to adapt them, by intelligent cultivation, to American conditions. And it is from these border carnations, too, that we are to expect the best varieties for pot culture.

If we fully accept the above propositions I am sure that we shall find little difficulty in growing border carnations in America. Gardeners of foreign birth often dismiss the hardy carnations by saying that our climate is too hot and dry for them. While there may be much truth in this position it is also true that many and perhaps all of the border varieties can be grown here with little trouble. Some persons have grown them with perfect satisfaction for years, and visitors to the World's Fair in early August must have noticed a glowing bed of them upon the wooded island. In order to determine if these plants can be successfully grown with only ordinary care, such as any person can give, we secured seeds in the spring of 1892 of the following strains: Early Margaret, Self Colored, Early Dwarf Mixed Vienna, Red Grenadine, Splendid Rose-leaved, Picotee and some others. These were sown in boxes in the greenhouse on the 8th of March, but they might just as well have been sown out of doors when the season opened. The plants were set in the field as the season advanced. A few of them bloomed in the fall. They were allowed to grow through the winter wholly unprotected, although they grew upon a bald hill top; and the last winter was severe at Ithaca. They all wintered well, and they began to bloom about the middle of June and gave an uninterrupted display of bright colored and interesting forms until late in August. Although the lot was a mixed one, having come from seeds, all the varieties were interesting, particularly the single flowers. If any one strain were more pleasing than another it was probably the Vienna, which bore single and semi-double little flowers of very pure and dainty colors, ranging from ivory-white to rose-red. Some of the plants had been taken up in the fall and removed to the house for winter bloom, and here, too, the Vienna was very pleasing. These hardy carnations are perennial, although so good results can not be expected from the subsequent seasons of bloom, and it is best to raise new plants annually. A collection of the best named border sorts from Europe would undoubtedly afford some excellent varieties for this country. At all events they could be depended upon to give perfectly adaptive offspring in the course of a very few generations of plants.

In the discussion Mr. Hancock said that some years ago he imported some 120 varieties of the English border carnations and he had been sadly disappointed in them. The flowers were not equal to those of our own varieties, the blooming period was very short and but few had the upright growth essential in a border plant. Mr. Hill had tried several varieties and Pride of Penshurst, yellow, was the only one that was of any value, and the value of that was not great. When in Erfurt he had seen acres of the plants in bloom and they were a grand sight. The wealth of bloom was truly marvellous. He invested several hundred dollars in the plants but a year later he had nothing left to show for his investment. Mr. Lonsdale said that the cultivation of the border carnation in England was not so general as seemed to be supposed. It was only in certain favorable localities that quantities are grown.

The paper by Prof. Wm. Trelease on "Carnation root galls" was then presented, and drawings showing the progress of the disease were passed around among the members. We shall print this essay in next issue with engravings from the drawings mentioned.

A question from Mr. Long brought out quite a discussion on the keeping qualities of carnations. He stated that during a stated season flowers sent him had been uniformly worthless the second day though flowers from the same grower had always kept well before. Mr. Sunderbruch thought that the trouble was due to cutting the flowers when the bench was too dry, or not stood in water before shipping. Mr. Dailledouze said he always cut flowers 24 hours before shipping and stood them in water during that time. Mr. Allen thought the trouble had been due to a stretch of dull weather coupled with possibly too much heat, making the flowers soft. Mr. Dorner agreed with Mr. Allen. He also held that flowers should invariably be cut and allowed to stand in water for from eight to twenty-four hours before shipping. He found that this materially increased the size of the blooms as well as their keeping qualities. He was also careful to never cut flowers from plants that had been allowed to flag in the least. Mr. Ward said he cuts his flowers early in the morning, before the bright sun strikes them, puts in water for a few hours and then ships.

This concluded the regular program. Votes of thanks to the Society of Indiana Florists, the Indianapolis Florists' Club and the daily press of Indianapolis were passed, and on motion the society adjourned to meet again in Boston the third Thursday of February, 1895.

The Banquet.

The banquet on Tuesday evening tendered by the Society of Indiana Florists and the Indianapolis Florists' Club was an event that will be long remembered by those who were fortunate enough to be present. The menu was excellent, the toasts were responded to with grand effect, and the decorations were superb. The tables were decorated with handsome plateaus of various flowers at intervals of eight or ten feet, connected together by bands of bloom through the center of the tables. At the head of the table this band was studded with cattleyas. The arrangement was done by Miss Emily Dorner and Mr. Ed Bertermann, and was worthy of all praise. The room was decorated with palms and similar plants, and the pillars and side walls were effectively draped with vines. With the arrival of the coffee and cigars, Mr. Hill

announced the unavoidable absence of President Hunt of the state society, owing to the illness of his wife, and introduced Mr. W. W. Coles, president-elect, as the presiding officer for the evening. Mr. Coles spoke of the great progress made in floriculture in Indiana since the organization of the state society seven years ago, and he was proud to claim as a member Mr. Fred Dorner, Mr. E. G. Hill and others. He recited a "poem" that would have been worthy of Deacon Harris, of Philadelphia. To correct a false impression he stated that Indianapolis was not "out west," but was the first good stopping place on the way. An Indianapolis Glee Club then rendered a selection. The club was a feature of the entertainment, and generously responded to many encores during the evening.

Mr. H. N. Spann, an amateur, welcomed the visitors on behalf of the local club, and he was a host in himself. He mingled humor and pathos in his address, and his speech was received with long and continued applause. He said that he wanted it understood that as a state Indiana was all right. It was first in politics, last in politics, and always in politics. Indiana had produced many excellent things, not the least of which were Dorner, who raises magnificent carnations and White Caps, who raise h——. He extended a hearty welcome to this modest state, and if anything was lacking in his speech he assured his hearers it was in his heart. To be a perfect florist one must be a lover of the beautiful, of the beautiful that comes fresh from the hands of God. Every flower that is born is the child of the Creator, and no man, no matter who he may be, has ever produced anything as beautiful as a flower. God may have produced more beautiful things, but if so He has not revealed them to man. In producing new carnations the two flowers must be brought together in holy wedlock. Back of the new flower must be intelligence, painstaking and continued effort. What the amateur don't know about flowers would fill several volumes, but what he thinks he knows would fill a library. He made many hits on local characters, and said that in Garfield Park they now raised grass, weeds and politicians. He had discovered that Mr. Langstaff had been putting the salted almonds in his pocket under the impression that they were the seed of a new kind of sun flower. Local florists had been discussing the necessity of a floral market, and one member of French descent had related one of his experiences at the present market, at which the horses of the market men have much latitude. He said: "I show a fine chrysanthemum to ze lady, and as I show zem to ze lady ze horse bite ze head off," and, added the speaker, it is a question in the club to this day whether the horse bit off the head of the chrysanthemum or the lady.

Mr. Coles then introduced the Rev. Mr. Carmody as toastmaster of the meeting, adding that he understood the title had been picked up on the Midway Plaisance. Mr. Carmody announced that being placed at the handle of the pump he would work it for all it was worth, and guaranteed to secure a stream of eloquence, which he did. He said all the railroads of importance centered in Indianapolis, that Indiana had more railroads than any other state, and as a nation could be called a car-nation, and a fit home of the flower in whose honor the present meeting was held.

Mr. Hill then read letters of regret from Messrs. Wm. Scott, of Buffalo, B. P. Critchell, of Cincinnati, J. H. Ladley, president of the Chester County Carnation Society of Pennsylvania, and others. The first toast was "The American Carnation Society and its future," which was ably responded to by Mr. C. W. Ward, of Queens, N. Y. Mr. Ward compared the carnation of five years ago to that of the present day, and held that the society had done much to make possible the marvelous advancement. The future is full of possibilities, and Mr. Thorpe's ideal is now at hand. He paid a glowing tribute to Mr. F. Dorner for his work in the production of the improved varieties.

Mr. Edwin Lonsdale, of Philadelphia, responded to the toast "The carnation in its commercial relation to the rose." He held that there could be no war between two classes of flowers. The better you grow the carnation the better will be the demand for roses equally well grown. We must produce a good article and then ask a good price for it. If we don't get all there is in it it's our own fault. He held that such carnations as were shown in the present exhibition could be made to bring as high as $15 to $20 a hundred if properly placed on the market. While there is always a glut of poor stuff there would always be a demand for fine stock at remunerative prices. At the conclusion of his address Mr. Lonsdale responded to a request for his famous song, "The Brave Old Duke of York," and all joined in the chorus, including the glee club.

"New carnations and their desirability" was the subject assigned Mr. C. J. Pennock, of Kennett Square, Pa. He threatened to read some forty pages of typewritten opinions on the subject, the reading of which would only take two or three hours, but finally forbore and dismissed the matter by saying there could be no question as to the desirability of new and improved varieties.

"Our friends, the professors in the experimental stations," was responded to by Prof. J. C. Arthur, of Purdue University, Lafayette, Ind., in a felicitious address that won rounds of applause. Some paper carnations that filled the "Ideal" were displayed on the tables. They had been brought by Mr. Michel, of St. Louis, who had discovered them in Brooklyn, and in response to a request he described how these grand flowers, four inches in diameter, and with four foot stems, had been produced to order at only twenty-four hours notice, showing that it was no great trick to reach the ideal in short order.

"Our allies—the horticultural press," was responded to by Mr. G. L. Grant, of the AMERICAN FLORIST. He looked upon the horticultural press as a means of greatly extending the educational influences of such meetings as the present, and of bringing the most distant into closer relationship with each other. It was through the press that the trade was first made aware of the fact that a new carnation star had arisen in the state of Indiana, which has since shed so much light on American growers. Through the medium of the press the speakers at the present convention were addressing not only those present, but thousands of others all over the country, and the audience by this means included every florist in the land.

In responding to the toast of "The society of American Florists," President J. T. Anthony, of Chicago, said: "Less than a dozen years ago the society of American Florists existed only as a visionary creation of the brain. If anyone prior to that time had thought of the need of such a society in this country it was quickly laid aside after reflecting upon the difficulties attending the formation and chances of maintaining such a society, The society of American Florists is an infant in years, having passed less than half the years of its majority, yet in our short existence we have gathered around us quite a number of strong and vigorous offspring, all of which we most earnestly desire to recognize us as the parent and to some extent the foundation upon which all should rest. It is generally believed that within a very short time the society will have granted to it a national charter, in which case it will be desirable to have the carnation, the chrysanthemum, the rose, and other offsprings from our society become more closely allied to the parent society. While we would not for a moment wish to interfere with the noble work of either of these societies in their chosen field of research still I think this can be better accomplished by a closer alliance with the society of American Florists."

"Fall exhibitions, how to make them useful factors in promoting the interests of the carnation?" was responded to by Mr. A. M. Herr, Lancaster, Pa. He said that the subject required more work than talk. By following Mr. Dorner's plan, and adding pot plants as a feature success would be attained. Mr. W. R. Shelmire, of Avondale, Pa., responded to the toast "The Chester County Carnation Society." He said: "If any one supposes we have as yet reached the acme of perfection he is sadly mistaken. It is very true the alloted time has about passed and Mr. Thorpe's ideal, as he painted it is not present with us to-day. But the progress from year to year is steady and sure and the flowers exhibited here show a decided advance on those shown a year ago at Pittsburgh. But a glance into the future reveals a wonderful development. Forms we have never dreamed of, colors rivaling (for they could not surpass) those of the rainbow, perfumes as the spices of the south seas. The carnation is plastic as clay in the hands of the potter, and, as we grow in knowledge and master the intricacies of cross-fertilization we shall produce those things, wondrous flowers, beauty in every petal, grace in every stem, their fragrance a delight to the senses. We will have particular races for special purposes. The dainty small flower of exquisite shade and perfect in form. The larger flower, three to four inches we will say with stiff long stems, expanding petals and colors of every hue. We will have the Dorner stock and the Lonsdale stock and the Swayne stock, and the Pennock stock, and the Ward stock and the Cæsar stock, and innumerable other races. And they will all fill their alloted mission. We will have also the rose flowered and the aster flowered and the sun-flower flowered. The flowers will be a foot across with stems five feet high and as thick as a corn stalk, and they will cost $10 apiece. We will have the pæony flowered and lastly those which partake of the nature of the "mum." Think not, gentlemen, this is but a dream of fancy. The chrysanthemum flowered carnation is a veritable fact and we will have them in the various shades and colors peculiar to the dianthus race. Let me describe this new carnation wonder. The bud is flat resembling that of a chrysanthemum. The stem is thick, stiff and erect. The leaves are rather broad with a graceful curve. The flower expands slowly at first, pushing its petals out flat. These recurve and twist. The center ones grow up and likewise twist, gradually expand-

ing forming a somewhat round head. Here we have a flower, easily taken for a "mum." More singular yet the flower is compound, not indeed in the same manner as the composite family, but around the central ovary there are several florets which throw out separate petals and often stamens. The ovary also frequently throws up petals instead of making seed. The flowers expand 3½ to nearly 5 inches and remain open a long time. This is not a monstrosity, it is a progenitor of a new race, and we can only dimly see the future. Now we can say the queen of autumn had better be looking to her laurels. The carnation suffers immeasurably for a few months in the fall by the chrysanthemum craze. If she can be met on her own ground and the new rival usurp the throne of this cabbage headed queen, all carnation growers would rejoice with exceeding joy and be profoundly thankful for the good time to come."

Mr. Dorner was called upon, but excused himself on the plea that it was easier for him to raise a new carnation than it was to make an address. In response to calls addresses were made by Messrs. Frank Alley and John Hartje, of Indianapolis, and E. G. Gillett, of Cincinnati. Mr. Wallace sang a song that was well received and Mr. Hill made some closing remarks. Three rousing cheers were given by the visitors for their hosts and the company dispersed after a most enjoyable evening.

Society of American Florists.

The annual meeting of the executive committee of the Society of American Florists was held at Philadelphia on Tuesday and Wednesday, February 13 and 14. Several members of the committee were absent on account of sickness and for other causes. The session was very harmonious and the interest manifested in the work of the society indicated that the members of the committee are fully alive to the importance of the coming convention at Atlantic City, which will in all probability be the largest gathering in the history of the society.

The following subjects were selected to be presented at the convention in the form of essays:

The value and importance of statistics, foreign and domestic.

Floriculture, its progress from an artistic standpoint.

Orchids as commercial flowers.

Greenhouse construction (by a constructor and by a practical grower).

Insecticides and their application.

Fertilizers and their application.

The best methods of growing roses, and best varieties for present demands.

Cannas.

Carnations to date (under auspices of the Carnation Society).

Recent improvements in chrysanthemums and their culture (under the auspices of the Chrysanthemum Society).

The committee on the matter of fire insurance for greenhouses reported progress and are in hopes to make some satisfactory arrangements in the near future. The committee on charter has also been busily at work. They strongly urge that every member of the Society of American Florists communicate with the Congressman representing his district and endeavor to get him interested in the passage of the bill of incorporation when it is reported to the House by Mr. Hatch's committee.

Owing to the attractions peculiar to Atlantic City it was decided that the evening sessions should be omitted during the convention at that place and afternoon sessions substituted. On recommendation of the Philadelphia Florists' Club Mr. George C. Watson was elected to the position of superintendent of the trade exhibition. Orders were given for a new die for the society badge, which will be superior in style and finish to that used heretofore.

The following resolution was unanimously adopted:

Feeling that in the death of George W. Childs humanity loses a champion and desiring to spread upon the records of our society some expression of the feelings which animate the hearts of our members; therefore,

Resolved: That by this sad event horticulture has lost a sagacious and enlightened counselor and patron, the world a benefactor to the friendless and unfortunate, one whose great loving heart was always open to the cry of the widow and the homeless, one who was always relieving the wants of the friendless and unfortunate, a pure and devoted philanthropist and an ardent defender of the rights of men.

Resolved: That we tender to Mrs. Childs our heartfelt sympathy in her great sorrow and bereavement and we mourn with her the loss of one of God's noble men.

[See Philadelphia notes for report of banquet.]

Philadelphia.

Wednesday evening, February 14, was a gala night for the Florists' Club, they having for guests at their annual banquet the executive committee of the Society of American Florists. The headquarters of the committee being the Colonnade Hotel arrangements were made here for the banquet, which was served in mine host Crump's best style. There was no attempt at elaborate decoration, although there were some very pretty plateaus of flowers and foliage and vases of choice blooms of roses and carnations, arranged in the centers of the various tables. At the head was a vase of Helen Keller carnations, magnificent flowers placed there to add inspiration to President Lonsdale. Directly in front of these was a plateau of fine foliage plants, as pretty as flowers (they should be used oftener), either side of this a short distance away was a plateau of cattleyas, and at intervals down the tables were baskets of daffys, roses and mixed flowers. Of the old style was a plateau of camellias, and another of acacia, and one of poinsettia sent in by Brother Westcott, and there were some vases of choice carnations, some Bouton d'Or, the new yellow sent by Dailledouze Bros., a very fine variety, and some very good flowers of different varieties from the Cottage Gardens, sent by Mr. Ward. There were also some plants arranged about the large mirror at the head of the table, the mantel being banked with Farleyense ferns, in which was a cluster of Harrisii lilies. Asparagus was also draped on chandeliers and the lace curtains over the windows.

On President Lonsdale's left sat the retiring president, W. R. Smith, while on his right was President J. T. Anthony; next him were Judge Hoitt, Mr. H. B. Beatty, Mr. J. C. Rennison, Elijah A. Wood, Eugene Dailledouze, Major Bonnaffon and John N. May. On ex-President Smith's left were ex-President Robt. Craig, Secretary W. J. Stewart, Ernst Asmus, E. H. Michell, of St. Louis, who was a substitute for Mr. Waldbart, E. A. Seidewitz and Mr. Feast of Baltimore. Among others from a distance were Messrs. Holzapfel, of Washington, Renard, of Unionville, Herr and Shroyer, of Lancaster, and Alex Wallace, of New York. Everybody seemed in the best of humor, and the way Major Bonnaffon and a certain individual called Dan kept "Woody," who happened to be across the table from both of them, from going to sleep was great amusement for those within hearing. Elijah wasn't caught napping very often, however, and although it was two to one, and the one not very large at that, he held his end up in great style.

After the cigars had been passed around President Lonsdale called for order, he made a short address of welcome to the executive committee, in which he said he was very happy to have the pleasure of their presence, and introduced Mr. Craig as the toast-master of the evening. Mr. Craig made a short address and spoke feelingly of the late Mr. G. W. Childs, he alluded to the Philadelphia convention when Mr. Childs did so much for the members of the S. A. F., and said that he would always live in their memory. For the first speaker he introduced ex-President Smith as one of the brightest lights in the society, and one to "whom the nation turns for what is best in botany and what is best in Burns," alluding to Mr Smith's love for the Scotch poet.

Mr. Smith said that one of the grandest thoughts to him was that he was an honorary member of the Phila. Florists' Club and he was proud of it. He was also retiring president of the S. A. F., a higher honor no man need want. Presidents of Republics may be grand, but presidents of Florists' Associations, those noble people who are elevating mankind and doing so much to stimulate the esthetic soul of the American people, are the grandest people on the face of the globe. The honest, manly, American florist will occupy the highest position possible for man.

President J. T. Anthony was now introduced and stated that he was not much of a talker, but tried to be a worker, that if in his position he made any mistakes they would be failures of the head and not of the heart, he had the good of floriculture and horticulture at heart as much as any one. He predicted a great convention at Atlantic City next August, and said that he was sure that the Phila. Florists' Club would do all in their power to make it a success.

Judge Hoitt was the next speaker. He said this was his second visit to Phila., he had been asked to speak on legal points for florists but said he wouldn't, his friend Burton for one didn't need any and he would spare them. He thought Atlantic City was a very satisfactory place to hold the convention and predicted a large attendance; he said he had been to other places where they had beaches and water and been much benefitted by it. He hoped they would come to New England some day so that he could return in a manner the hospitality of the club.

Mr. J. C. Rennison, of Sioux City, was asked to respond to the toast the Far West. He said he was from pretty far west where they had buffalo and Indians, but he was no speaker and asked Judge Hoitt to tell what he knew of Sioux City. The Judge gave a humorous account of a visit there and said that if any present wanted to enjoy true western hospitality they should go west and call on Mr. Rennison, who would he knew be very glad to see them and would treat them in true

western style, he spoke of the railroads and more especially of the terminal facilities, which he said were superb.

Mr. Wallace, of New York, now favored the company with a song which was well received.

Mr. E H. Michell, of St. Louis, now responded to the call of Mr. Craig. He said that while it was a great pleasure to be entertained yet it was a greater one to be the host. He said that they in St. Louis were glad to have had those who were present last summer, but would have liked to have had more; he spoke of the great possibilities of the southwest, and thought it was the place to carry out Mr. Smith's idea that many things that we imported might with a little experience be grown in that neighborhood, and much money that went abroad could in this way be kept at home.

Mr. H. B. Beatty, of Oil City, was introduced, and began by saying that if he had the talents of the distinguished general who marched his men so untiringly up the hill and down again, or was like his friend the able, brilliant, but forgetful Robert, or had the grace and dignity of my friend from Washington, he might be able to do justice to this occasion and to this City of Brotherly Love, around whose name is clustered all that is noblest in our nation's history. Here was born the stars and stripes which now and forever shall stand for all that is best and noblest in our nation's life. Here the cradle of liberty was rocked in unison with the tones of that beloved bell which tolled the doom of monarchy in our wonderful country and made possible for you and me the American Beauty. In the inmost recesses of our hearts there is enthroned a queen, and to each of us severally she is the only American beauty, beside which the brilliant queenly American Beauty pales and is forgotten. Here's to the health and happiness of our absent ones, but ever present in our hearts, the American Beauty, our wives and sweethearts.

George McMillan here sang a comic song, after which Secretary Stewart, for whom the song of "He is a jolly good fellow" was sung with a will, as it was in fact for all the other jolly good fellows who spoke, was introduced as a friend and worker for the society since its inception.

Mr. Stewart spoke feelingly of the loss the press felt in the death of Mr. Childs, and said that Phila. had a long record for her horticultural press. The old *Gardeners' Monthly* was the only horticultural paper of its day, and all we had for many years. The horticultural papers have a great mission to perform; it lends its support to the right, condemns the wrong and is doing everything it can to advance horticulture. All should help the press, as all ground needs some return for the crops it gives, so it is with the press. In conclusion he said he was glad to be with them and wished to thank them for their hospitality, which was so great that a fellow had to be on the lookout or he was in danger of being sent home with the short span to the south.

E. A. Wood was now introduced as the last of the executive committee, but not least by any means. Mr. Wood answered in a humorous vein; he said that it took experience to know just what to do, and he thought the fellows who said it was best not to have evening sessions at Atlantic City spoke from experience. He said he liked to come to Philadelphia, that he felt more at home here than in any other city he visited. He predicted the meeting next August would be as large as any held anywhere and thought Boston would send her largest delegation to Atlantic City. He was then called on for "Jingle Bells," which he sang in good style, and in which the company joined keeping time on their glasses.

Mr. Shroyer, of Lancaster, was introduced as coming from a city which had more glass to the population than any other place in the country. He gave a humorous account of Mr. Smith's headquarters at Washington and hoped that everybody would visit Lancaster, and he could assure them they would not regret it.

Secretary Farson was now asked to explain some reference to him by Mr. Shroyer, and after having disposed of that gentleman he turned his attention to other speakers whom he said might make money by going into the stump speech business; they knew so well how to work the patriotic racket, it was our tender spot. Whenever the cradle of liberty was rocked and the Independence bell was rung everything was lovely and the visitors owned the town, even the last cent would be spent if necessary for their comfort.

Mr. E. A. Seidewitz, of Baltimore, said they had tried very hard at Toronto to get the society to come to Baltimore, but his worthy Washington friend had been too much for them, however. Some day in the future they would give them another invitation and hoped they would be more successful. He spoke of the achievements of Baltimore florists of the past and alluded to the death of Mr. Childs, who while he made his home in Philadelphia yet was a Baltimorean by birth and they all felt his loss keenly.

Mr. John N. May, who was the last speaker, said he had hoped to escape, he was like Mr. Anthony, more of a worker than a talker. He referred to the kindness of Mr. Childs during the convention of 1886, and said his example was worthy of emulation by other wealthy people of the country. Horticulture in its broad sense was in its infancy yet, and all could help a little to get its long clothing on. Flowers were not used in this country in anything like the quantity they should be. In Europe in many places 90 per cent of the windows of the houses had plants in them. Our business would rise to immense proportions if anything like this love for flowers could be generated in this country, he longed to see the day when this love for flowers would become universal. He alluded to the efforts of Mr. George Vanderbilt, of Asheville, N. C., who was doing so much and on such a grand scale for forestry, thousands of acres being planted with every tree and shrub indigenous to this and other countries.

As it was now late Mr. Alex Wallace was called on to lead with that great song "Auld Lang Syne," in which the company joined with a will, and thus closed a very happy occasion.

Owing to the weather business has been for the most part at a standstill, pleasant weather seems to be essential these days to keep things moving. There are a good many blooming plants coming in now, but cold disagreeable weather seems to put people out of the notion of them. A few bright days of sunshine would, we believe, start a lively business in window plants and gladden the hearts of the growers.

For all the demand has been light the supply has scarcely been equal to it, and some flowers have been quite scarce. Good Beauties and hybrids are not to be had; whether it is no sun or from some other cause these large roses are not up to the mark. Most of the Brunners lack substance, do not seem to open after being cut, and soon fall apart, 40 to 50 is the price just the same. $5 per dozen is high for Beauties, the majority bringing $16 to $25 per hundred, the choicest of the larger teas bring $8 to $10, while the majority are sold for from $6 to $8. Small roses bring 3 to 5. Carnations in large lots are sold at from $7.50 to 10 per thousand, the 100 price being 1 to 3, the majority bring 1.50. There are a great many new varieties about, but from some reason many of them go to sleep very quickly. The question now is not what color is it, or does it burst easily, or has it a good stem, but how does it keep? There are some beautiful varieties of carnations being put upon the market at the present time, which when fresh seem to be almost perfection in every particular, but the next day finds them ready for the barrel. It seems to us that here is a theme for the Carnation Society to take hold of. They should first insist on proving this qualification before passing on any other. Then when anyone wishes to lay in a stock of new varieties that have the sanction of the society he will know that they are all right in this essential and he can use his judgment as to the colors he should grow.

In speaking to a prominent bulb importer he said that he had been credibly informed that in the great majority of cases the foreign agents who will soon be seen about soliciting orders for bulbs for next year do not pay any passage money in coming across the water, as the steamship companies supply tickets free in order that goods may be sold, and then they get returns in the shape of freight on these shipments.

The meeting of the executive committee at the Colonnade was convened on Tuesday last and continued for two days. Some very interesting subjects for papers and essays were decided on and assigned to men whom it was thought would be most competent to handle them. There were also a number of questions selected for the box. The meeting was a very harmonious one and all seemed to think the proceedings of the next convention would be as interesting as any that had gone before. K.

The New Mushroom.

(*Agaricus subrufescens*, Peck.)

BY WILLIAM FALCONER.

[*Extract from essay read before the Mass. Hort. Society Feb. 17.*]

In the summer of 1892 I found quantities of a new-to-me, uncouth looking, wild mushroom growing on and about the leaf mould piles at Dosoris. The mushrooms were not scattered about, one here and one there, as we find the common one in the fields, but they came up in bunches of two, three or may be a dozen or two growing together, But the crop was not steady—there might be a great quantity this week, very few the next week and lots the week following, and so on. After a rain they would spring up like magic. There were about forty loads of rotting and decomposed leaves in that pile, and there was a gentle heat in it all summer long; while the whole mass two feet deep was permeated with the spawn most of the mushrooms came up in the oldest part of the pile. I was studying the new comer with much interest.

About that time my attention was called to the fact that Mr. Boulon, a neighboring florist, was picking a large quantity of mushrooms in his greenhouse

and frames and selling them in New York, getting big prices for them. I went over to see him and found the rumor true. But it wasn't the common mushroom at all that he was growing; it was the interesting stranger I was studying in our leaf mould pile at home. It appeared with him the previous year. He had old violet beds inside of his grape and tomato house, and they were full of mushrooms; old hotbeds in his nursery were run over with mushrooms, and he had mushrooms in the open ground among his asparagus between rows of pear trees. They were coming up wherever planted like a crop of weeds, and in the sunshine and shade with apparent indifference. He was picking an average of 35 pounds of them a day and getting 80 to 90 cents a pound for them in New York, mostly at hotels. He had a bonanza and he was increasing his mushroom growing facilities proportionate with his visions and circumstances. While the mushroom has behaved with varying grace to him since then, it seldom has cropped as well or been so productive as it was the first year.

After watching its habits and testing its quality I sent specimens to Prof. C. H. Peck, our state botanist at Albany, for identification. He found it to be a new species, and has named it *Agaricus subrufescens*. In his annual report of the state botanist of the state of New York, 1893, page 25, he gives a technical description of the species, and its origin.

The new mushroom has undoubtedly come to stay, especially as a summer cropper. But for some years to come its culture will be restricted to private families and commercial growers doing a private business. Before now the price of spawn—$5 for a 5-pound package—was prohibitory, but I believe spawn will be offered next spring by two or three parties, and cheap enough for everybody to try it.

The advantages of the new mushroom are its extraordinary productiveness when it does well and its adaptability for growing in summer. We cannot control the old sort out of doors with any certainty, and what we may grow of it in sheds, cellars or frames during the warm months are apt to be so infested with maggots as to be unfit for food. The new mushroom, on the other hand, can be grown outside all summer, and as it springs up so fast the larvæ of the little flies have hardly time to develop before the mushrooms are gathered for use. It is no more maggot proof, however, than is the old mushroom.

The disadvantages of the new mushroom are its toadstool appearance, uncertain behavior and the fact that its crop comes in spurts—lots today and maybe none tomorrow. But further personal acquaintance may overcome our prejudice against its looks and practical experience correct its behavior in cropping. Bulk for bulk, it is not as heavy as is the common mushroom; while its cap is deeper and broader, it is thinner and lighter. It does not burst its veil as soon as the other sort, but when it does it gets old quicker than the other; hence it is considered a poorer shipper. It is very good to eat. It has a pronounced mushroom flavor and in cooking exudes a fair quantity of juice and the flesh is tender. Several persons I know prefer it to the common mushroom, but for my own part I am inclined to favor my old and toothsome friend *Campestris*.

The best method of cultivation of the new mushroom is not yet properly understood. That it requires more heat than the old mushroom is generally conceded, also that it needs more water. By repeated practical experiment it has been proven that it grows as well in winter as in summer, providing the cultural conditions are favorable to its development. It will also grow in a cellar of Egyptian darkness as well as in the light; in fact darkness whitens the mushrooms and rids them of much of their outdoor coarseness. The lavish success that we have had with it at one time and perfect failure at another, under apparently the same conditions, convinces me that there are vital points in its cultivation that we do not yet understand. Sometimes we may plant a bed with the spawn and in four or five weeks mushrooms begin to appear, and in two months from planting time we have an enormous crop. Then again we may plant another bed in the same way and the spawn runs in it as prettily and thoroughly as in the other, completely permeating the whole mass of manure, and it won't bear a mushroom, and we don't know why. What shall we do with such a bed? Take it out to a warm, dry airy shed or loft and spread it out to dry, it will make first rate spawn, and the probabilities are that the next bed you make up and plant with this spawn will produce a heavy crop of mushrooms. Under date of January 31 last Mr. Boulon wrote me: "Under my control the new mushroom has grown any time in the year, but I find that it is more productive in summer than in winter. In winter after one picking we have to wait ten to fifteen days for another picking. In summer the crop is more regular. It is a good acquisition for summer use. The *Agaricus campestris* cannot be grown well in summer on account of the maggot, but *A. subrufescens* grows so quickly that the maggots have not time to develop in it. The cultivation is very easy and needs very little care. If one doesn't want to make a special bed for it he can plant the spawn between early cucumbers or melons or other early crops under glass."

Writing to me last September, Mr. W. H. Daniels, a florist and mushroom grower of Mamaroneck, N. Y., told me that he had made up two beds, each 60 feet long by 2½ feet wide, and planted them with the new mushroom. The manure was just right. About two weeks from time of planting the spawn had run through the beds, appearing like a thick film at every crack between the bottom boards, then he moulded them over with loam and otherwise treated them like the common mushroom. In due time they came into bearing, the young mushrooms appearing all over the beds about one-fourth grown, and there they stood like that for some days. There was something lacking. Then he thought of water, and he gave the bed a good soaking; the result was that the mushrooms swelled up and he had an immense crop. He made up succession beds, and February 2 he wrote again: "I have not gathered a mushroom yet this winter of the new variety. I made up a bed in my violet house and spawned one-half of it with the common mushroom and the other half with the new mushroom, and I am now gathering plenty of the common variety, but not one of the new variety, although the bed is a solid mass of spawn. I had an idea when I spawned the bed that the house would not be warm enough for the new mushroom, but I concluded to try it.

"I sold some of the spawn to a private gardener near me and advised him to put it in a warm house, which he did. The result with him has been a grand crop. I saw his bed about two weeks ago and it was a picture then. He told me that he had been picking from it for over eight weeks and was delighted with it. After the success I had with it last summer I shall certainly grow it again next summer. I do not think it is quite as good for shipping as *A. campestris*, but for home trade and gathered when fresh open my customers tell me that it is superior in quality to the old mushroom."

I wrote Mr. Daniels asking him for particulars about how his neighbor grew the mushrooms, and under date of February 8 he kindly replied as follows:

"Today I paid a visit to the gardener I told you about to obtain from him the secret of his success. He laughed at the word 'secret,' and said he had no secret about it; the only thing was the hint I gave him about planting it in his warmest house. He made up his bed about a foot deep under the hot water pipes, but concluded to box it in, as he thought the heat from the pipes would dry out the bed too much, otherwise the bed was made up and spawned exactly as for campestris. 'A great cropper,' was his exclamation; he never was without mushrooms from that bed for eleven weeks. The manure in the bed was only 75° when he planted the spawn, but it kept at that heat a good while. He estimates that although it takes a greater bulk of the new mushroom to the pound than it does of the old one, he gets more than three pounds of the new mushroom to one of the old sort from the same space of bed. And he declares while he can get spawn of *A. subrufescens* he will never go back to *A. campestris*.

"One thing he likes about the new variety is that if the bed is at all dry on the top a light watering with a rose pot does not injure the young mushrooms, but benefits them, whereas with the old one it is generally injurious to the young pin heads."

In the fall of 1892 I gave spawn to Mr. Griffin of Westbury, who cultivates mushrooms extensively for market in capacious cellars under the barns and heated with hot water. In the winter of '92-'93 he planted some beds with this spawn, but didn't get any mushrooms from them. The beds, however, were a complete mass of spawn, so he took them out and dried the spawn for future use. Last fall he again made up and planted some beds with this spawn, and he has had immense success, the mushrooms coming up in great clumps or basketfuls. He wrote to me about them and I sent Mr. Lendel Hallock of Queens to see if he could get me a photograph of them, but on account of the narrowness of the pathways in the cellar and other complications he could not get a photograph by flashlight or otherwise. Mr. Griffin and he, however, took a clump growing in a 2x1 foot space, slipped it into a flat and carried it out of doors to have its picture taken. It contained ninety-one mushrooms, large and small, and weighed six and one-half pounds. The mushrooms were two days too old and the caps had become widespread and darkened with spores; this was because he had kept them without picking for me to see.

Under date of January 30 Mr. Griffin wrote me: "I would very much like you to see the new mushrooms; there is no doubt about it being a fine cropper and easy to grow, more so than the other variety, under just the same treatment. I have a lot here that we are eating every day, for I am sorry to say that it will not

ADIANTUM FARLEYENSE.

take in the market; in fact before I knew it it had spoiled several shipments for me, as I packed them with the others, so we have to eat them ourselves."

Mr. Griffin's bed that is now in bearing is built on the ground and right under the hot water pipes. After the beds were spawned the atmospheric temperature was kept up to nearly 70°, but as soon as young mushrooms began to appear it was lowered to 60°. All of the beds till they come into bearing are kept covered with a thick layer of rank straw shaken out of the manure. When bearing begins this covering is removed except a light scattering which neither prevents the mushrooms from coming up nor obstructs one in gathering them, and it keeps the surface of the ground quite moist.

"Spoiling his shipments" may need explanation. He ships altogether to commission men. They don't want and will not handle any mushroom except the old one, for their customers won't take any other, so when Mr. G.'s mixed lots reached them they picked out and threw away all of the new mushrooms, retaining and paying for the old variety only. The new mushroom with its whitish gills, pale lemon tinted neck and thick furry veil has a good deal of a toadstool look about it, and especially since the "mushroom" poisoning scare of last summer the people look with distrust upon everything in this line except the genuine *campestris*.

Adiantum Farleyense.

The accompanying engraving is from a photograph of a plant grown by Mr. James G. Kyle, Newport, R. I. It is in a 10-inch pot, is 14 months old and is four inches across. In response to a request for a description of his cultural methods in growing this grand adiantum Mr. Kyle writes as follows:

"First of all, in my estimation, I would give first place to Adiantum Farleyense. I consider it the queen of the maidenhair ferns; it does not require any more heat than crotons, dracænas or any stove plant, succeeding with a temperature of 60° to 65° in winter. Farleyense is a strong grower, and the cultivation is very simple. My experience in propagating this variety is, as we all know, only by division of the crown. I never propagate from a plant less than a 4-inch pot and upwards; anything below this I consider too weak to expect strong stock from. To begin with I take a plant, cut all the fronds down to the crown, take a sharp pointed knife and divide the crown into the smallest pieces, just one eye on each piece. The eyes around the outside of the crown are preferred, as there is a chance of them having a little piece of root with them, which is a great advantage in starting them up again. The reason I take them so small is I can get a better plant and strong fronds after once they start up, whereas by dividing the crowns into larger pieces you will get nothing but a lot of short, unsightly fronds not worthy of the name of Farleyense.

"When I get all the stock I want I take a piece of good rotten sod and an equal part of leaf mould, mix well together and pot the eyes into thumb pots, putting them in a small frame on the bench in the warmest end of the house, with a bottom heat of 85° to 90°. In making this frame make a few holes in the bottom of your bench underneath to let the heat come through; then put about six inches of sphagnum moss inside the frame and plunge the pots right into the moss. Give a thorough watering, put a sash over the frame, but do not at any time keep it close. Raise up your sash about 18 inches at one end and keep it there all the time. By keeping your sash close the young fronds will damp off as soon as they come up. If you find that the pots dry out too soon take them out and put more moss into your frame, as there is no use giving so much water when there are no roots.

"In about seven or eight weeks they will be ready for shifting into 4-inch pots; for this shift and all others I use good old sod, shaking out the fine stuff and adding rotten cow manure and leaf mould in equal proportions. Mix thoroughly and don't pot very firm. Put them back in the frame for a couple of weeks, then set out on the open bench. Be sure there are plenty of crocks in the bottom of your pots; good drainage is very needful, as they require lots of water. My objection to using peat and charcoal is that they make the foliage too light in color.

"My benches are all iron and slate, so I cover them with half an inch of moss, giving plenty of moisture. The night temperature is 65° and the house has a slight shade in winter and a heavier one in summer."

Buffalo.

Our city, with a large part of the country, has had a good old fashioned blizzard accompanied by a large quantity of the "beautiful." Buffalo people, or a large part of them, are always praying for snow in its season, but in reality we are getting too big a city for snow and sleighs, and a great fall of snow is now a beautiful nuisance. Lent did not come in and leave behind any impressions of a very gay season. Business has been steady and the funerals of several prominent citizens made many of our retailers quite busy, but there was since New Years a great dearth of social events, which made quite a difference to the bulk of business done.

Carnations are now plentiful of all qualities and colors. Violets are also very plentiful and much reduced in price, although they all went off on Valentine's day with many other flowers. It was a good day all around. It is strange that good Mermets should be so scarce for the past month as they have been. It cannot be laid at the door of "old Sol," for we have had more bright days this winter than for many seasons past. Store windows are very gay just now with daffies and bright colored tulips and they sell very fairly.

Mr. George Pickleman who has leased the large establishment of Mr. Aldrich on West Seneca, just outside the city line, is preparing plans to remodel the whole structure. George says they shall be iron if it takes gold to pay for them.

Our enterprising florist Joseph H. Rebstock has just secured a lease of a fine store on the west side of Main street near Chippewa, and almost opposite his present stand, with a new front and great alterations in the interior, and a conservatory attachment in the rear. It will when opened for business be one of the largest and most finely fitted stores in the country. The ice box will be modelled after one that is well known in Washington, D. C., and will be some 40 feet long, 8 feet high and 3 feet deep. Joe says he needs that height, so he won't have to cut off the stems of his Beauties.

Mr. W. J. Palmer, in company with the writer, visited several of the greenhouses in Corfu last week. He took a good look at the carnations houses of W. Scott. One is *short* span to the south, the other an *equal* span and although the new fashioned house has the advantage of being on the south side of the equal span, yet it did not take the veteran Palmer but

an instant to see that the advantages of light were overwhelmingly on the side of the equal span, and as the owner is most emphatically of that opinion, there was no chance for a row. Webb Bro. are looking well. A large bench of those two fine carnations, Daybreak and Nellie Lewis were in grand order. A good source of revenue to them must be two long houses of violets, looking the picture of health, and from which they are picking thousands of perfect flowers. W. S.

New York.

General dullness and inactivity extends all through the various branches of trade. This surprises nobody, it would have been surprising had it been otherwise. Dealers have settled down to endure as best they can the inevitable, and but little complaint is heard, although there is plenty reason for it. Very cold and stormy weather has prevailed throughout the week, so the cut of flowers has been greatly curtailed, and the overstock which would otherwise have resulted from the lack of demand has not yet begun to make itself felt. In roses the quality of the stock coming in varies greatly. Some growers are cutting the finest roses they ever produced; this is especially true of some of the Watteville, Mermet and Bridesmaid growers. Others are having unusually poor results this year. In American Beauty there is a larger proportion than usual of useless blooms. The new rose, Mrs. W. C. Whitney, grown by J. N. May is coming in beautiful shape and shows every indication of becoming a popular market variety.

Carnation growers still keep up a keen rivalry and the near approach of the annual meeting of the Carnation Society helps to maintain the interest. On every side one hears discussions without limit about rooted cuttings, rust, stiff stems, big prices, pollen parents, etc. and the craze will be on until the Carnation Society meeting is past and the rooted cutting season is over. From present indications there will be quite a number of the New York fraternity at the Indianapolis meeting.

Bulbous stock shows no signs of improvement. Double daffodils are the only flowers in the bulb section that maintain anything like their old time hold on the market. Lily of the valley has never sold so low as it does this season. Harrisii lilies are also moving very poorly.

Cattleya blooms have been in excess of the demand this season, and for the first time since they became a staple in the market the price of these flowers has taken a serious drop, many lots not realizing more than twenty to twenty-five dollars per hundred.

It is reported that Robert Young will soon retire from the auction business on account of ill health.

After the retirement of Mr. Robt. B. Young his auction business will be continued by Aug. Rolker & Sons.

Mr. E. V Hallock sailed for Europe on the Majestic Wednesday.

Chicago.

Business holds up pretty well; in fact it is generally said to be unusually good for the season, and the shipping trade is exceptionally good. There is not an overstock of material, except in the line of bulbs. Good roses are rather scarce, particularly Beauties. Hybrids are not in the market yet; a few indifferent Neyrons and other sorts have been sent in from pots, but none from solid beds. Beauties still go up to $5 a dozen for the best. Meteors are from $6 to $8 per 100; La France, Bride and Albany $5. Some very richly colored Albanys with extra long stems are grown by Bassett & Washburn. All good roses are in excellent demand, and so are good carnations, ordinary varieties selling for $1.25 to $1.50; fancies $2 to $2.50. Fine Scotts are coming from Hancock & Son, Grand Haven, Mich., and they are greatly admired, selling on sight.

Bulbs are extremely slow, even valley taking a drop, a good quality selling for $2. Romans are a little firmer than they were, and Dutch hyacinths are worth $5 to $8, some of them being extra fine. Daffodils go very slowly, selling for $3 to $4, and tulips are equally slow, some extra fine Chrysolora being worth $5, but the average is much below. Callas don't go at all, and Harrisii is very slow at $4 to $8.

Among miscellaneous flowers are some extra fine forget-me-not, which is worth $2; mignonette at $1.50 to $3; marguerites at $1. Violets are in great demand at $1.50. Smilax is still a drug.

Mr. O. P. Bassett will return from California this week, after quite a lengthy absence.

Mr. H.W. Buckbee, of Rockford, was in town this week.

A number of the local brethren were at Indianapolis this week, attending the sessions of the Carnation Society.

O. J. Friedman has rented a new store at 145 State street, which place will be fitted up in an elegant manner. The firm will take possession of their new quarters the first week in March, but for the present at least their present place will also be kept running. Landscape gardening will be a new departure. Mr. John Thorpe, who has been connected with Mr. Friedman for some time, will be in charge of this branch.

Toronto.

A new and interesting plant is blooming at the greenhouses at Reservoir Park just now—Richardia Eltoniana (I believe that is right), the yellow calla lily sent out by Messrs. Hugh Low & Co. last year at $25 each. I regret I have been unable to get out to see for myself what it is like, but I hear that the bloom is similar to and as large as the common white calla with the exception of the color, which is a bright allamanda yellow, the leaves are spotted like the Richardia maculata, and the plant is a good strong grower. Not having seen it I can't say whether it is likely to be useful to florists, but from the description given I should say that it would. There are not many on the continent, and peradventure this is the first to bloom, if not it would be interesting to hear from others who have flowered it.

This city has an economical fit on just now, a mean parsimonious fit one might call it. The estimate for parks and gardens came before the committee the other day and was cut down and slashed until below the minimum for keeping things in decent order. Supt. John Chambers will no doubt do the best that can be done for the money, but his hands will be necessarily tied. Five thousand dollars was allowed to improve and add to the conservatory at the Horticultural Gardens in order to receive the collection of plants donated by Sir D. L. Macpherson last year, but every other improvement asked for by Mr. Chambers was relentlessly struck out. What a pity it is that men who really understand the subject of parks and gardens are so rarely seen in city councils, those who do have the authority generally think they know more about it than their superintendents, and the result is a kind of "penny wise and pound foolish" policy. E.

Boston.

Business in the city remains very fair for Lent, and while the wintry weather which we have been experiencing continues there will be no difficulty in finding sale for most of the stock coming in. Roses are particularly in short supply at present. There is a ready market for all that are of sufficiently good quality. Callas and Harrisii lilies are about the only flowers that are badly overstocked. The commission men and the growers who frequent the flower market all speak favorably of this week's trade.

The retail men in the city are all moderately busy. Outside, especially in the manufacturing towns, there is much complaint from the local florists, for the stoppage of many of the mills and factories directly affects their trade, which comes principally from the employees of these establishments.

Some pretty blooms of the Christmas rose were shown at Horticultural Hall on Saturday, February 17, by the Bussey Institution. Everybody admires these flowers and it is singular that so few of them are grown.

W. A. Manda, of Orange, C. B. Weathered and J. S. Taplin, of New York and A. T. Boddington, of Short Hills are in town this week.

McGee & Tiernan is the name of a new retail flower firm on Broadway, Chelsea.

Pittsfield, Mass.

A well attended meeting of the Berkshire County Gardeners' and Florists' Club took place February 14. The meetings have hitherto been of a very cold and uninteresting nature, and after some discussion an essay committee of five was appointed to provide an essay for each meeting. It is now hoped a new impulse will be generated and kept on, and that the meetings in future will prove of material interest and benefit to the members.

The eel worm is causing great uneasiness in the fraternity in this section and much damage is done to roses in the best greenhouses in the county. As a consequence rose buds are not so plentiful as desired. Mr. A. P. Meredith, who has had his eye on the worm through the aid of a powerful glass, is experimenting as to the origination, cause and best preventive against it, with his well known energy in everything he undertakes, and it is hoped he will succeed in his task. Other prominent members are also doing their duty, and at our next meeting some practical talks are expected on the evil eel worm. In the meantime it would be wise to watch the roses with a scrutinizing eye. W. M. EDWARDS, Sec'y.

LENOX, MASS.—The gardeners and florists of Lenox and the vicinity have during the past month organized a society that is to be known as the Lenox Horticultural Society, of which E. J. Norman is president, J. F. Huss, vice-president, A. Huss, treasurer, and A. H. Wingett, secretary. It has started in a most satisfactory manner, and it is hoped that it will prove very advantageous to all its members by making them more acquainted with each other and their different methods of obtaining success.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

SITUATION WANTED—By practical German gardener; middle aged, single man. Best references. Speaks a little English. J K, care Am. Florist.

SITUATION WANTED—By a lady, where she can thoroughly learn decorative and designing work; salary no object, but would expect board and lodging. C. E., Henly, Hays county, Texas.

SITUATION WANTED—By florist and gardener; well experienced in all branches; age 25. Best of references. Private or commercial place. Address S 100, care American Florist, Chicago.

SITUATION WANTED—By a German as florist; a place with private family preferred. Age 23. Can give refereences if wanted. Address ADOLF STADLER, gen. del. Minneapolis, Minn.

SITUATION WANTED—By young man of 20 to learn the florist trade. One year's experience on private place. Penna. preferred. Address S C G, 231 N. Penn St., Allentown, Lehigh Co., Pa.

WANTED—Greenhouse assistant; young man with some experience and intelligence. State references and wages with board per month. Address Box 353, Middletown, N. Y.

WANTED—By March 1, in private greenhouses; experienced assistant gardener; German; salary $40 a month, room without board Address E H, care American Florist.

WANTED—Gardener, single, who understands raising vegetables and fruits for market. Give references and state wages with board. Address P. O. Box 186, Mt. Pleasant, Iowa.

WANTED—A good worker and experienced grower of roses, carnations, chrysanthemums, and general stock of plants. Good State wages. Address ALFRED PHAUD, Crown Hill Cem., Indianapolis, Ind.

FOR SALE—One Kroeschell hot water boiler 4x12; 4 years in use Also about 4000 feet 4-inch pipe. ART FLORAL CO., 3301 Cottage Grove Ave., Chicago.

FOR SALE—Four greenhouses, well stocked, with very valuable piece of ground, reason for selling old age. Address WM. SPRINGBORN, Dubuque, Ia.

FOR RENT—At Riverside, Ill., greenhouses, boiler, pipes; all in running order. Rent cheap. Call or address PETER READEY, 1011 Ogden Ave., Chicago.

FOR SALE—Best opportunity to make money ever offered. A first-class florist establishment, and the only one in one of the best college cities, with over 6,000 wealthy people. Splendid cut flower trade all the year. Everything new, with big stock of plants for spring sale. Write for particulars at once. Don't miss this chance. G J, care American Florist.

FOR SALE—Four greenhouses, of about 4000 square ft. of glass, heated by hot water; about 150 sashes, about 1000 square feet of glass loose in boxes; 800 feet of 4-inch pipes, valves, etc. About 25,000 tuberose bulbs (Pearl). The greenhouses are filled with all kinds of the best selling pot plants to bed out in the spring. Stock in first-class order. Winton Place is a nice suburban residence of Cincinnati. The business is at the Spring Grove Cemetery—it's the largest and prettiest in the state. I am at the C. H. & D. and near the C. W. & B. R. R. station; also street car accommodation. No other florist around. Owner of place will give buyer a lease. Rent reasonable. Reason of selling is because I wish to build upon my own ground (a few miles west of here) Buyer can have possession of place at once. Will sell reasonable, for cash. Also large stock of violets. For particulars address H. SCHLACHTER, Winton Place, Ohio.

FOR SALE.

1, Six Section Carmody's Champion boiler; 21 Carmody's sash lifters with two wheels and attachments The above have been in use one year and are in perfect order. 30 Hotbed Sash, Coleman's patent, 3x6, 3 runs; 15 never been used; 15 been used about two months. Well painted with two coats of white lead and oil; all Cypress. 225 feet 2 inch pipe. 500 feet 1½ inch pipe. Plenty Tees, Elbows, Unions, Reducers, etc 16 Ventilating sash all cypress. 700 or 800 feet of cypress greenhouse bars. 2000 feet of glass, 12x12 D thick, 12x18 sing S. In fact two greenhouses with all their equipment for sale at a bargain. Take note of this brother Florists in New Orleans, Birmingham, Vicksburg, Mobile and Atlanta. You will never see a better chance than this. All this equipment is new, not thrown out because it is too old and out of date I sell because I am tired of digging in the dirt, and sick of fighting so many pests. GEO. W. STABLE, Meridian, Miss.

Address THE AMERICAN FLORIST CO., Chicago.

A SPIKE OF CANNA bloom, a seedling of the Crozy type, was recently sent us by W. R. Adams, of the Omaha City Parks, who informs us that it is a most prolific bloomer, producing its flowers in quantity all summer. The color is light red, suffused with yellow, and though the flowers are medium in size the size of spike should make it very showy.

Orchid growers have another trouble to contend with in the shape of a beetle (Xyleborus morigerus) which infests dendrobiums and does much injury by boring into the shoots. It is said not to be a British species, but is supposed to have been imported with the plants. A correspondent of *The Garden* recommends immediate cutting off and burning of the infested shoots as the only course to pursue.

Mr. Walter Henry Williams of the firm of Keynes, Williams & Co., Hon. Secretary of the Wilts Horticultural Society for the past twelve or thirteen years and member of the floral committee of the Royal Horticultural Society, died at Parkhurst, Salisbury, on January 14 of pneumonia at the age of 31. Mr. Williams was an enthusiastic dahlia grower, his specialty being the raising of new varieties of the single and cactus type.

PARK RIDGE, N. J.—James Duncan, of this place has sold his greenhouse establishment to John Bennett, late of Rye, N. Y. Mr. Bennett will add to the glass, and conduct a general retail business with the assistance of his two sons.

MARINETTE, WIS.—Fisher & Burtenshaw is the style of a new firm here, composed of D. J. Fisher and F. Burtenshaw, the latter formerly of Chicago.

WILKESBARRE, PA.—Ira G. Marvin has sold his Plymouth greenhouses, office and stock to Wm. H. Van Fleet.

ERIE, PA.—Mr. H. Tong mourns the death, from membranous croup, of his 5 year old son Hubert, on January 26.

NEW ORLEANS, LA.—Mr. R. N. Little has removed to corner of Cadiz and Perrier streets.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer. 114 Chambers street, New York. Next annual meeting second Tuesday in June, (will probably be held in Toronto.)

Am. Seed Trade Association.

At the twelfth annual meeting of the executive committee of The American Seed Trade Association held in New York, February 6, 1894, it was

Resolved: That it is the unanimous voice of the executive committee of the American Seed Trade Association, meeting in New York, February 6, 1894:—That it is the undoubted sense of said association to protest most earnestly against the passage of the so-called Wilson bill as it relates to garden seeds appearing on the free list. That as a body of seed growers and seed dealers throughout the United States,—while advocating the retention of the present advalorem duty of 20 per cent.—we would strongly recommend the adoption of a specific duty upon the different species.

We are pronounced in this view for the reason that an *advalorem* duty tends to encourage the importation of low grade seeds to the serious injury of the crops of American farmers and gardeners. It is a well known fact that, with but very few exceptions, seeds of all varieties of vegetables can be grown of better quality, and in every way better suited to the American climate, at home than abroad. So thoroughly is this fact appreciated that European growers are compelled to send annually for American grown stock seeds. It will be seen that our advocating a really protective duty on seeds is not only in the interests of the American seed grower alone but the planter of seeds as well—the trucker and farmer. Seeds are not as raw material, quality is insured only at the expense of diligent labor,—such intelligent labor cannot be secured by the underpaid farm peasants of Europe.

W. ATLEE BURPEE, President.
A. L. DON, Secretary.

MR. E. V. HALLOCK of Queens expects to sail for Paris soon.

MR. W. ATLEE BURPEE will soon make a trip to California.

THE CANNERS of the U. S. held their annual convention in Chicago the past week.

THE SEVERE STORM or some other cause has caused a serious falling off in the mail trade February 12-17.

MR J. A. FRASER, late with W. Elliott & Sons is reported to have taken a similar position with Wm. Hageman, Phila.

THERE SEEMS TO BE a disposition among growers on contract to make some concessions on orders for crop of 1894.

VISITED CHICAGO: Everett B Clark, Hiers A Sulzer & Bro., Albert Landreth, W. A. Longbrake, L. J Corsell and Col. King of Minneapolis; R. Engleman, Omaha; C. H. Allen, Floral Park.

ALBANY, N. Y.—The Morrison & Westfall Co. has been incorporated here to deal in field and garden seeds, agricultural implements, etc., with a capital of $100,000. Directors, Leonard Morrison, Frank D Halstead and Philo J. Westfall.

NEW CROP ONION SEED
$1.00 PER POUND—
Either RED WETHERSFIELD or YELLOW DANVERS.
$2.25 PER POUND for American Grown Prizetaker,
In lots of FIVE POUNDS of one kind or assorted as desired. With every $5.00 order goes FREE a copy of Greiner's Newest and Best Book, "ONIONS FOR PROFIT," telling all the Secrets of Success in Old and New ONION CULTURE.

If You Garden for Profit
you can save money and should buy at Wholesale Prices, as quoted in BURPEE'S BLUE LIST for 1894. It is mailed FREE to Market Gardeners everywhere, who, while entitled to *the lowest prices possible*, should always be sure to get Only the Best Seeds That Grow! BURPEE'S SEEDS ARE WARRANTED,—*few equal, none better*—and are annually sold direct to many more planters than are the seeds of any other growers.

W. Atlee Burpee & Co., Seed Growers, Philadelphia, Pa.

☞ If you have not already seen BURPEE'S FARM ANNUAL for 1894, write for it TO-DAY. A handsome book of 172 pages, it is pronounced by papers everywhere *The Leading American Seed Catalogue.* It tells all about the Choicest Vegetables and Most Beautiful Flowers for THE HOME GARDEN.

GREENHOUSE HEATING.

BY A. B. FOWLER.

Explains fully all the best systems of heating greenhouses by both hot water and low-pressure steam. Tells you the points to consider in selecting an apparatus. How to adjust same to various locations; gives the results of the latest scientific experiments. Shows how to compute the number of feet of pipe required for a given space; draft and other important matters.

It is highly commended by Mr. John Thorpe and others. Postpaid, 75c.

Sent on receipt of price. Address,
AMERICAN FLORIST,
CHICAGO.

St. Louis.

A week of continuous cold weather has kept the market in a healthy state, and as a result stock has been selling well right along. Shipping orders have been more numerous also, and have helped to keep things going. Lilac has made its appearance in fair quantity, and seems to take fairly well; quite a number of tulips also have been on the market, but are not selling any too freely.

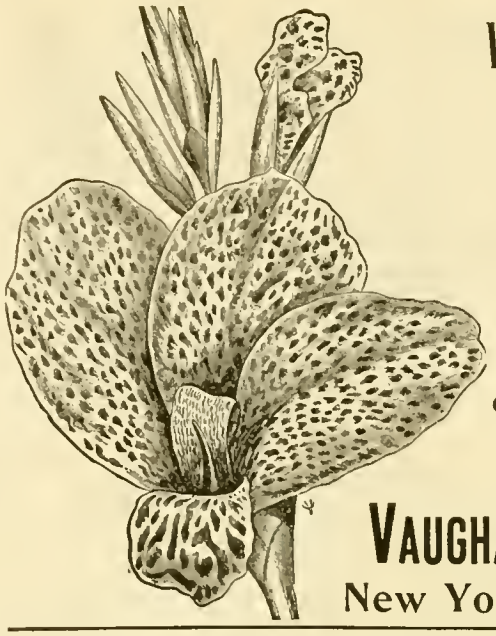
The last meeting of the bowling teams was well attended and was quite exciting; the high record of 238 for this series was twice broken, Mr. Beyer rolling 248, and afterwards Jules Benecke made 257. From present indications it appears as though Mr. Benecke will capture both the medal for highest individual score, and also for highest average. Dr. Helwig, captain of team No. 2, electrified the boys by making a score of 87 for a full game, and it will be some time before he hears the last of the matter. Team No. 2 in its third game rolled a total of 1274 pins which is the record to date. R. F. T.

Baltimore.

A week of unexampled extremes in temperature has just ended, beginning with a Sunday mild and balmy as a day in later May. By the middle of the week we had January in appearance and temperature, hard frozen snow and ten degrees Fahrenheit, finishing with another Sunday like the last.

Trade in flowers and house plants continues fair. To be sure, the heaviest demand in flowers is for funeral work, as people die right along in Lent as well as at other seasons, but a very nice little percentage comes from our Jewish citizens, who marry and are given in marriage regardless of Christian fast days, and who, with all their supposed closeness, are very fond of flowers.

Mr. M. A. Hantske's new store, No. 1414 North Charles, near Union Depot, is a great improvement on the old one.



Mr. John Wiedey is reported as being quite seriously ill. MACK.

FRED. ROEMER, SEED GROWER,
QUEDLINBURG, GERMANY.

PARIS, FRANCE.—A serious fire and explosion was caused by the upsetting of a lamp in Vilmorin, Andrieux & Co.'s establishment February 11. The flames were put out before serious damage was done, but an after-explosion, caused by bringing a candle into contact with an oil tank, shook all the adjoining buildings and seriously burned seventeen workmen and ten firemen, one of whom was killed outright.

How Shall We Classify Them?

I would like to know in what class you locate a certain kind of florists who send out trade catalogues and then sell a dollar's worth of plants to one's customers as low (and sometimes lower) than to the florist. To a man up a tree they are worse than the street fakir or the dry goods man who adds flowers to his stock. JED MOUNT.

COLEUS.

Our stock is large and handsome, consisting of 70 to 75 varieties, including the very newest kinds.

ROOTED CUTTINGS, in 30 to 40 varieties, (our selection), at $6.50 per 1000 by express; in 20 varieties, at $1.00 per 100 by mail.

NEW KINDS, including some of the most handsome ever offered for sale, in 10 varieties, at $2.00 per 100 by mail.

Golden Verschaffellii and Mrs. I. D. Haight (yellow), at $8.00 a 1000. *We will include* at least 50 cuttings of the *new kinds* in every 1000 purchased.

CARNATIONS.

A large stock of BUTTERCUP in prime condition.

Rooted Cuttings, $5.00 per 100; $40.00 per 1000. Prices of other kinds on application.

Send for circular. Safe delivery guaranteed in all cases.

W. R. Shelmire,

. . . AVONDALE, PA.

The Best Carnation in the Market.

THE ADELAIDE KRESKEN

Which was originated in 1891, and flowered in the same year, is conceded by all to be the prettiest Carnation ever grown. Strong grower, free from rust, 1½ ft. high, stiff stem, good calyx, and the flower (of a beautiful rosy pink color) averaging three inches and over.

A VERY FREE BLOOMER. In addition to receiving the Best Seedling Prizes at Cincinnati, O., Club Certificate at Springfield, Mass., and Milwaukee, Wis., Hunt Prizes, Indianapolis, Ind., it has received Certificates of Merit at the American Florists' Society, St. Louis, Mo.; also the best vase of pinks at St. Louis, Mo., and Certificate of Merit at Toronto. The undersigned begs leave to submit the following exceedingly low prices for Rooted Cuttings, which will be ready March 1st, 1894: $2.00 per doz.; $10 per 100; $15 per 500; $80 per 1000.

Cash must accompany all orders. Address all communications to

Another Good Hand.

Some unsolicited testimonials in regard to **SWEETBRIER.**

S. Lancaster. Mass , Jan. 26th.

Dear Sir:—I am much pleased with the cuttings of Sweetbrier. They are ideal plants to send out.

Yours truly, E. O. ORPET.

Lancaster, Pa., Jan. 29th, '94.

Mr. Ed. Swayne, Kenuett Square, Pa.

Dear Sir:—The plants came all right and are a credit to their grower. Many thanks for your promptness. Yours truly, ALBERT M. HERR.

Alliance, O., Feb'y 7th, 1894.

Edward Swayne.

Dear Sir:—I will say this much for Sweetbrier, that it is an excellent keeper. Mr. Davis when taking orders here, left with us about one dozen of these beautiful carnations, and in 18 days thereafter we used one in making up a bouquet, and the party getting it remarked "Oh what a beautiful carnation." They had been kept in a cellar without ice. Yours respt.,

J. F. ZIMMERMAN.

Neville Island, Feb. 7, '94.

Edward Swayne, Keunett Square, Pa.

Dear Sir:—Carnations rec'd this afternoon in very nice conditiou Please accept our thanks for fine stock sent. The cuttings were clean, strong and well rooted. Yours truly,

BECKERT BROS.

Raudolph, Mass., Feb. 10th, 1894.

Mr. Swayne.

Sir:—Can you send us *now* "500 Sweetbrier"? If so, you can ship and we will send check immediately. Saw some you sent Mr. E. Cartwright, much pleased with them.

Yours respt., MANN BROS.

SWEETBRIER

Received 1st Premium for "best seedling of any color" at Phila., Nov. 7, '93. Color between Daybreak and Wilder.

Flowers brought $5.00 per 100 wholesale, at J. K. Freeman's, Washington, last winter.

"I like its color better than Daybreak."

EDWIN LONSDALE.

"Sweetbrier is all that can be desired."

We have a large stock of Daybreak, Puritan, Edna Craig, Aurora, McGowan, Nellie Lewis, and other leading varieties. Also immense stock of Mammoth Verbenas.

Send for prices on what you want. Catalogue ready about January 15th. Send for it.

VICK & HILL, Rochester, N. Y.

PLEASE mention the AMERICAN FLORIST every time you write to an advertiser.

CARNATIONS.

Varieties good. Cuttings good. Lizzie McGowan, Silver Spray, Aurora, Grace Darling, Portia and J. K. Freeman, at $1.25 per 100; $10 per 1000. Fred Dorner, $2.00 per 100; $12.50 per 1000. Daybreak, at $2.50 per 100; $20.00 per 1000. Edna Craig, $3.00 per 100; $25.00 per 1000.

Annie Pixley and Helen Keller.

PIXLEY is one of those beautiful light pinks, with a fair sized flower and good, strong calyx. With ordinary culture stems can be cut twenty inches long. The flower is a model in form, and the growth is strong and healthy.

KELLER you know all about, they are both sure to make good paying varieties for cut flowers.

Pixley per 100, $12.00; per 1000, $100.00.
Keller per 100, $12.00; per 1000, $90.00.

Verbena Lancaster Beauty.

Decidedly the prettiest Verbena that grows, novel as well as beautiful and sells at sight.

Price, per 100, $2.00.

PANSIES.—I can still supply a few of those seedling plants at $5.00 per 1000, or 75 cts. per 100. The same good strain I always have.

No list published and terms are cash before shipping or C. O. D.

Coleus at $7 per 1000. Alternanthera, transplanted, Red, Yellow, Pink, $1.25 per 100; rooted cutting, $6 00 per 1000.

L. B. 496. **ALBERT M. HERR, LANCASTER, PA.**

EVERYBODY who sees the new and beautiful Fancy Carnation "HELEN KELLER"

are favorably impressed with it, and generally leave an order.

JAMES HORAN, Florist, **Bridgeport, Conn.**

Legal Pointers.

Liability of telephone company for mutilation of shade trees.—It has been decided in Canada that the owner of abutting property may maintain an action against a telephone company for injury to ornamental shade trees on the street in front of his property, where such company has been authorized to construct its lines along the streets of the city, provided it shall not cut down or mutilate any trees, where there is no evidence to rebut the presumption of ownership to the middle of the street.

WM. SCOTT —AND— **GOLDFINCH.**

The former is the most prolific carnation we ever grew. It produces fully double as many perfect blooms as any other carnation we have ever seen. Of a most beautiful delicate pink, easy to grow and quick to sell. Goldfinch is a boon to florists for who does not need a good yellow, one that is sure to produce abundantly large perfect flowers. Such as one we believe Goldfinch to be. Send for prices on these and all other leading carnations in the market. GEO. HANCOCK & SON, Grand Haven, Mich.

VICK'S NEW WHITE BRANCHING ASTER

THE FLORISTS' FAVORITE.

Has no superior (often sold by Florists for Chrysanthemums). Easily grown from seed. Anticipates the Chrysanthemum by several weeks. Has long stems; flowers pure white, 4 inches or more in diameter; petals broad, long, and many of them more or less twisted and curled. Plant is a strong grower, and has marked tendency to form numerous branches.

Packed in plain small packets or envelopes ready to place inside your own seed bags or in our regular bags.

DAN'L B. LONG,
Wholesale Florist,
Buffalo, N. Y., Feb. 2, '94.

JAMES VICK'S SONS.

"The flowers of Vick's New White Branching Aster received from growers last fall were remarkable in character and about the best selling flower we handled during the year." DAN'L B. LONG.

GENEVA, N. Y., Sept 15, 1893.

JAMES VICK'S SONS.

Gentlemen—I am very enthusiastic in favor of Vick's New White Branching Aster, it is one of the most valuable novelties that has been introduced of late years. When other asters were in their prime these were just beginning to open their buds, and now the others are mostly faded away the Tall Branching is in full flower and in all its glory. Where it has plenty of room it is about 3 feet high, well and evenly branched, full of large, pure white splendid flowers, and an abundance of buds that insures its continued blossoming until cut down by frost, even if such an even does not take place till well into October. I can not say too much in its praise."

GEO. S. CONOVER.

SALTER BROS., Florists.
Rochester, N. Y., Feb. 3, '94.

MESSRS. JAS. VICK'S SONS.

Dear Sirs—"We consider Vick's Branching Aster the finest White Aster in existence. The flowers are equal to Ivory Chrysanthemums. In our estimation it can not be given too much praise."

Legal Pointers.

Purchasing without any reasonable expectations of being able to pay.—A contract for the purchase of goods on credit, made with intent on the part of the purchaser not to pay for them, is fraudulent, and if the purchaser has no reasonable expectations of being able to pay it is equivalent to an intention not to pay.

Orders can not be countermanded after delivery of goods to carrier.—Orders can usually be countermanded at any time prior to their formal acceptance, or, in other words, so long as they can be by the other party rejected without creating any liability. But after orders have once been filled and that which was ordered, delivered, unconditionally, to a common carrier, as to a railway company, for carriage to the person or persons giving the orders, it is not within his or their power to successfully countermand same by any notice, no matter when mailed, which does not reach the seller prior to the delivery of the goods to the carrier.

Rights and duties of purchasers finding goods not as warranted.—There has been no little controversy in the courts as to the right of a purchaser to accept goods and rely upon the warranty thereof where they are found upon arrival at the place of delivery not to be in good condition. But the great weight of authority, as well as reason, is now well settled, says the United States Circuit Court of Appeals, that in cases of this kind and character if the goods upon arrival at the place of delivery are found to be unmerchantable in whole or in part the purchaser has the option either to reject them or receive them and rely upon the warranty; and, if there has been no waiver of the right, he may bring an action against the vendor to recover the damages for a breach of the warranty, or set up a counterclaim for such damages in an action brought by the vendor for the purchase price of the goods.

Read before signing.—It is remarkable how frequently otherwise careful business men will sign papers handed to them without first reading same. Stories are sometimes told of tests being made by friends and their getting signatures to checks and other documents which evince the greatest negligence. From the rural districts there arises in the courts one long and continuous protest against paying obligations unwittingly given to sharpers. But the law on the subject is well settled and plain. The Supreme Court of California says in a recent case (Smith v. O. & O. Steamship Co.) that when a person with the capacity of reading and understanding an instrument signs it he is bound by its contents, and is estopped from saying that its provisions are contrary to his intentions or understanding. Fraud and imposition may furnish grounds for relief under some circumstances, but not always, especially where negotiable paper has been transferred to innocent holders for value.

TO TAKE PLACE OF WIND MILLS

HOT AIR PUMPING ENGINES

A Windmill

Is unreliable because it depends upon the elements for its power; hydraulic rams also depend upon favorable conditions and waste as much water as they secure. Steam pumps require skill and hand pumps demand labor and time. The

DE LAMATER-RIDER OR DE LAMATER-ERICSSON Hot-Air Pumping Engines

are especially designed for pumping water, and from shallow streams or any kind of well. They are simple, safe and reliable, require no steam and have no valves. They require very little heat to operate them, and can be arranged for any kind of fuel.

J. HORACE McFARLAND, Harrisburg, Pa.

Worcester, Mass.

Whether or not Lent will spoil it all is an open question, but it is pleasing to chronicle the fact that we have had good trade during the last three weeks; quantities of first-class stuff and very fair prices.

Roses are still in short supply on account of the dark weather, but when old Sol condescends to show us the light of his blooming countenance more frequently we will probably have roses in abundance.

An enormous lot of funeral work has kept everybody busy and helped to dispose of quantities of good flowers that otherwise would have gone into the rubbish heap.

The only social event of any importance happening lately was the Childs-Moen wedding on February 1. The decorations were very pretty though quite modest, as they drew on their own conservatories for a good deal of their stuff. The decorations were under the supervision of Fred Wesson. SEEDLING.

TUSCOLA, ILL.—The Tuscola Floral Co. has started in business here with two greenhouses, each 16x50.

HARTFORD, CONN.—John M. Harper has purchased the old stand of Thos. McRonald. Mr. McRonald has built a new range of greenhouses on another street.

CLEVELAND, O.—Mr. J. M. Gasser started recently on a two months trip through the south and west. He will visit all the points of interest in the south and California, returning by way of Salt Lake and Denver.

KANSAS CITY, MO.—Mr. Arthur Newell, of Newell & Kidd, was married January 23. After the wedding Mr. and Mrs. Newell took a trip down south. The bride carried a very handsome bouquet made of lilies of the valley and cattleyas presented by Mr. Sam'l Murray, manager of the Probst Floral Co.

Announcement to Florists.
We desire to announce the dissolution of the firm of Sipfle Dopffel & Co., and to introduce to the trade its successor, The Syracuse Pottery Co., which will be under the management of William Dopffel and Conrad Breitschwerth. The business will be conducted as heretofore, except on a larger scale to meet the growing demand for our goods. We have accordingly enlarged our plant and capacity, and with unsurpassed facilities are now prepared to fill the largest order on short notice. Our latest improved machines are turning out the best and most serviceable flower pots in the market, and assuring you of our intention to lead in further improvements we solicit a continuance of your patronage in the belief that we can supply just what is needed at a price and in a manner satisfactory to all.
Send for price list and samples and we know you will give us an order.

Our Carnation Pictures.

The engravings that appear in this issue are from photographs taken at the Indianapolis meeting of the American Carnation Society of vases of flowers there on exhibition. Below each vase is a scale by which the size of the flowers can be readily determined. In photographing the reduction was made the same in each case so the comparison between them as far as size is concerned is accurate. Strength of stem, etc., is well shown by the way the flowers stand in the vase.

THE Chester County (Pa.) Carnation Society will give a carnation show at Wanamaker's, 13th and Market Sts., Philadelphia, March 8, 9 and 10. Flowers for exhibition should be forwarded, prepaid, to Wanamaker's, marked "Flowers for carnation show." They will be staged by the committee.

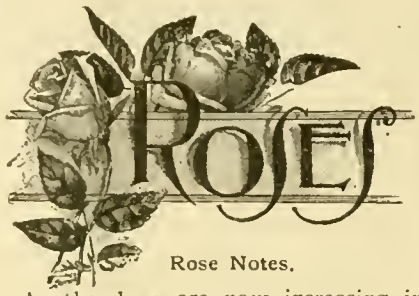
Cinerarias and Calceolarias.

BY KENNETH FINLAYSON.

[*Extract from a paper read before the Mass. Horticultural Society on February 24.*]

Cinerarias are propagated by seeds and cuttings, the latter method being seldom resorted to and only to be recommended for perpetuating extraordinarily good varieties. It is impossible to grow as large a plant in the same time from a cutting as from seed. The best seed ought to be purchased, for it is as easy to grow good strains as bad ones. The seed should be sown for large and early flowering plants in the latter part of May or early in June in pans or boxes four inches deep. These must be well drained and have a thin layer of sphagnum over the drainage to prevent the soil from entering it. The main aim in regard to the soil at this stage is lightness and porosity; therefore leaf mould and clean, sharp sand should be used in equal parts, with an additional fraction of fibrous loam. The pans or boxes should be filled within about an inch of the top and then made smooth and level. Sow the seeds evenly all over the surface; cover them lightly a little more than their own depth, press gently with a smooth board; then water with a fine spray-rose and put a pane of glass over the top of the pan to check evaporation. Consign the pans now to a frame to prevent draughts; the seeds will soon germinate, therefore be watchful and as soon as they make their appearance well over the soil remove the glass from the pans in order that they may not become lanky. If the frames are some distance from the glass the pans may be taken out and put on a shelf near the light, but not where the sun will strike them, for this would be instant destruction at this stage of their growth. The frames in which the plants are to be grown during the summer should have a northern exposure—that is, the higher side should face south and the lower side north. If there is a high board fence or wall as an additional shade, so that the sun could not shine on them at any time, this would be an ideal position not only for cinerarias, but for many other plants. When this cannot be found the glass must be painted with a thin coat of white lead mixed with turpentine or kerosene. Lath shades should also be made of the same width as the sashes, the framework one inch square with diagonal braces, and the laths one inch wide, half an inch thick and the same distance apart. The seedlings being in boxes underneath this carefully prepared canopy they will make rapid growth and in a short time can be transferred from boxes to three inch pots, returning them to the frames thereafter and plunging them in coal ashes or any other loose material up to the rims of the pots, coal ashes being preferable on account of its porosity and the barrier it offers to earth worms. The soil at this potting may have a further addition of loam and a corresponding decrease of sand, with a small quantity of well decayed cow manure added.

All that is necessary now for a while is shading, watering and syringing overhead at least once a day on hot, bright days—preferably in the evening when the sun has passed entirely over them—this furnishing the necessary moisture in the bed and keeping down thrips and red spider. Greenfly must also be looked after with the utmost vigilance. The best way to combat it, while the plants are growing in frames, is to chop tobacco stems and strew them over the surface of the beds to a considerable thickness, renewing them at intervals. This is the only time that cinerarias can be considered difficult to grow, for in spite of all care some of them are likely to vanish. The hot and dry atmosphere from the latter part of June to the middle of August is a severe trial to any rapid growing plant. After the middle of August it is comparatively easy for the cultivator, and instead of being at his wits' end to keep them living and healthy, his trouble will be to keep them provided with pot room, for, like many other rapidly growing plants, they should not become pot bound until they are in the pots in which they are to flower. For commercial purposes eight and nine-inch pots may be used, the latter being sufficient for very large plants.



Returning to the plants in the three-inch pots, all that are strong and healthy and have filled their pots with roots may be transferred to pots two sizes larger at each successive potting. This is for novices; but the professional may use one size larger, that is, from a three to a six-inch size, and from a six to a nine-inch, but much tact and knowledge are required in watering plants after such ample shifts. This extreme latitude in potting cannot be extended to any but rapidly growing plants. At this stage the soil plays the most important part. The chief component of soil for all plants with few exceptions should be decomposed sods from a grass pasture that has not been tilled for a considerable time. The best sods are those found in hollows in such pastures. The sods should be cut of the usual thickness for sodding and piled up with a layer of cow manure free from litter between every three layers of sods. If they can be left for a twelvemonth in this pile before using they will become mellow and better, and the fertilizing agents in the manure will be more thoroughly incorporated. The compost should be chopped with a pickaxe or spade before using, the fineness of the chopping depending on the nature of the plants to be potted, but it should never be too finely chopped or screened. Leaf moulds and fine clean sand in quantity according to the nature of the plants may be added at

this time, mixing thoroughly and if possible leaving the compost for a month before using. The soil will then go through a process of fermentation which will sweeten it. For the final potting of cinerarias a six-inch potful of pulverized sheep manure, a ten-inch potful of leaf mould and two ordinary shovelfuls of sharp sand may be added to the sods and cow manure.

In October the plants, being in the flowering pots, the pots should not be plunged more than one-third their depth in the plunging material. The nights increasing in length and the sun being less strong, evaporation is less rapid, and everything that tends to excess of moisture will make them spindly. Considerable of the morning and afternoon sun should be admitted to build up a stocky and sturdy constitution. The best strains are naturally stocky and will as a rule form pretty shapely plants without much training on the part of the cultivator, but some of them will be disposed to throw their leading flower head to a considerable height above the foliage, impairing the beauty of the plant. This must be corrected as soon as it is noticed by nipping out the central flower spike, so that the lateral spikes may assume the command, as they will almost invariably do, rising to a uniform height above the foliage and forming a close, dense head. The plants ought to be taken into the greenhouse any time in November for early flowering, which will commence in January, or earlier if desired. The proper night temperature in winter is from 40° to 45°, on bright, sunny days 55° to 60°, with abundance of air when the weather permits. With this treatment they will be so free from insects that there will seldom be occasion to fumigate more than once during the winter.

Cinerarias are gross feeders and will take an abundance of food after the pots are well filled with roots. Once or twice a week will not be too often to give it, provided it is not too strong and the weather is bright. A heaping tablespoonful of guano and the same quantity of soot in six gallons of water may be used; the soot intensifies the color. Liquid cow manure is very good as a stimulant and can be used freely. Standen's fertilizer is excellent, but as it is not easily dissolved in water it is better to spread it over the surface of the earth in the pots, where it will dissolve gradually. A teaspoonful is sufficient at one time for a ten or twelve-inch pot; it is better to repeat oftener than to give too large a dose at once.

The culture of the calceolaria is similar to that of the cineraria in almost every particular. The former, however, is not generally sown until about the first of August; the seeds being much smaller, require more attention in their early stages to insure success. Being even more impatient of high temperature than the cineraria, they require the coolest and shadiest position to germinate freely. They are also more sensitive to bright sunlight, and must therefore be well shaded in sunny weather. They must always be kept close to the glass, whether in frames or greenhouses, to encourage a sturdy and stocky growth. The green aphis is particularly partial to this plant; it will attack the under sides of the leaves and increase in great numbers before its presence is otherwise discovered, therefore the under sides of the leaves must be examined frequently. Strewing tobacco stems in quantities round the pot is the best way of warding off this enemy. The plants require an abundance of water when well grown, but as little moisture as possible should be tolerated on the benches when they are in full flower, otherwise the flowers will get spotted very quickly. Shading when in flower is very necessary, the beauty of the flowers being preserved thereby to double the time it would otherwise last.

Rose Notes.

As the days are now increasing in length they will give us also more sunlight, this means that more air and water can be given to plants in active growth, and where the soil is well filled with active roots and the plants show signs of needing more food some stimulant can now be applied, either as mulching or in the shape of liquid manure. If decided to apply as a mulching a thin coat of pure ground bone spread very evenly over the surface at the rate of twenty-five to thirty pounds to a house one hundred feet long by twenty feet wide, covering this with about half an inch of fine, well decomposed manure will be found of great service to increase the size and general quality of the flowers. As a general thing this will be found a much more satisfactory way of applying stimulant than in the form of liquid manure for the reason that every time the plants are watered a limited amount of this material will be carried down to the roots, which in turn they can more readily assimilate than if applied in larger quantities at any one time. It also acts very beneficially by gradually inducing new roots to form near the surface, which in time will take entire possession of this mulching, and where it does so the result is certain to be a great increase in healthy vigorous shoots and size of flowers, and where reasonable care is taken in watering the best results are usually obtained from this method. On the other hand, where the stimulant is applied in the form of liquid manure it very frequently happens that the plants get more than they can utilize, or, to be more explicit, over-watered. This means stagnation, which in turn causes a sudden check to the active growth; this must be guarded against at all times if the best results are to be obtained. To many of your readers this will undoubtedly appear unnecessary, as it has been so often repeated in these columns, but the same doctrine has been preached for generations to followers of horticulture, yet I fear many are still unbelieving even after they get into the "slough of despond," hence it may still be well to remind them not to get deeper into the mire. Some may say—"Why keep harping on a worn-out string," because they have never had any difficulty in this line, so much the better for them, but many of their brother florists may have been less fortunate. Probably the nature of their soil has very much to do with this. It is a well known fact that some soils can be given twice or three times as much water as others without injury, in fact, quite advantageously; but, let these same growers get hold of a close, retentive soil and the result will be very different. Any plant that from the nature of the soil can be watered very freely every day will invariably do much better than one that can only be watered at distant intervals, and to those having the latter the above is very much more applicable.

Where hybrids are forced and are now showing buds the size and color can be considerably improved by fairly liberal treatment from now until the blooms begin to open. To get really fine flowers of these they should get all the air possible during the day, when the weather will permit it, and the temperature never be allowed to exceed 50° at night. Where grown in pots or boxes to succeed other crops, such as chrysanthemums, etc., and where only a limited amount of flowers are required at one time this can very readily be managed by taking the desired number in at intervals of say ten or twelve days apart, this will keep up a fairly steady supply. For the very earliest Mrs. John Laing, Magna Charta, Anna de Diesbach, and General Jacqueminot are still the best; for the next Ulrich Brunner can safely be added, and for later crops Madame Gabriel Luizet, Baroness Rothschild, Merveille de Lyon, Mabel Morrison and some few others can be added. From now on most of these varieties will take from eleven to twelve weeks to get them in full bloom from the time they are placed in heat. When once they have started to grow never allow them to suffer from a check either from want of water or from sudden falling in the temperature. To get really fine flowers the plants must be well grown during the summer, carefully rested in the fall and protected in a cool house or similar structure as soon as bad weather sets in early in the season. The method for above treatment has been given several times in these columns.

Plants that have been forced early, if placed in a cool house as soon as through flowering, will with very little care bloom very finely if planted in the open ground as soon as all danger from frost is past. To many a florist doing a local trade these plants come in very useful for this purpose, and if the shoots which do not happen to bloom are made into cuttings, rooted, potted up and grown on liberally all summer they will make fine plants to bloom next winter, so that the stock can be continually renewed, and the plants sold or otherwise as desired after blooming.

Where the young stock of Teas for next season's supply has not been already provided for lose no time in getting the cuttings into the propagating house, choosing good, clean, healthy wood for this purpose and do not keep the temperature of the cutting bed too high, or weak growth will be the result.

JOHN N. MAY.

Among Chicago Growers.

EASTER POT PLANTS, ROSES, BULBS AND GENERAL STOCK.

Anybody interested in growing roses in pots will find many things of interest, and be able to gather much valuable information by paying a visit to the establishment of our veteran grower Mr. August Dressel. We mention roses in particular for the reason that Mr. Dressel for upwards of twenty years has made this his specialty, though large quantities of other pot stuff as well as cut flowers are grown here. Mr. Dressel has the reputation of producing pot roses second to none. This year, as usual, the stock is very fine and in much larger quantity is grown than ever before. We find half a dozen houses de-

PARTIAL VIEW OF MR. DORNER'S DISPLAY AT THE INDIANAPOLIS MEETING OF THE AMERICAN CARNATION SOCIETY LAST WEEK.

voted to growing these roses. A large part of them are intended for Easter, the balance for spring trade. The first lot consists of hybrids and Jacques. These are showing bud and are expected to be in full bloom at Easter. The selection of varieties is made with a view that in case all the plants can not be disposed of in pots the flowers can be sold when cut. The list is made up of such varieties as: Mme. Eugene Verdier, Paul Neyron, Mme. Gabriel Luizet, Baroness Rothschild, Merveille de Lyon, Marquise de Castellane, Mrs. John Laing, Ulrich Brunner, John Hopper, Gloire de Margottin and Anna de Diesbach.

In addition to the above there is also a batch of fine-looking La France finely budded. These plants had been flowering freely last summer and fall while growing planted out in benches, but finding that the outlook for a good winter cut was not very promising the plants were lifted and potted up.

American Beauty is treated in the same way. This rose flourished exceedingly well in the fall, producing a good cut of blooms, but later in the season did poorly, so bench after bench was lifted, the plants were cut back, potted up and after remaining in a cold house a few weeks, started up again, and we now find them in various stages of growth, which will make them fine salable pot plants.

For general spring trade, in addition to such varieties as above quoted, we see such other sorts as Clothilde Soupert, Hermosa, Mme. Plantier and a few mosses.

Most of the stock is imported every year from Europe. Last year's importation included a lot of Perles and La France which are intended only for propagation. Mr. D. thinks it a good plan to infuse new blood into his stock occasionally.

There are two large houses, or rather, sheds, which are built on purpose for storing this stock. Here the roses are carefully heeled in when received in the fall. These houses are piped sufficiently to keep out severe frost if necessary. It is here the roses are also kept after being potted until such a time as they may be wanted, when they are removed in such batches as may be required into other houses. As none of this stock is intended for earlier than Easter, none is forced in a high temperature, thus all make fine hardy plants.

Next to roses Mr. Dressell is also quite heavily into azaleas. There are two houses of these. Very few are desired for early flowering. The majority are intended for Easter and as this holiday comes very early this year, there will be little difficulty in keeping them back. When asked what varieties were in his opinion the best, Mr. D. replied with a broad smile: "Well, on the whole I would rather not answer your question. You see if I should give you a list of what I might consider desirable sorts, and also point out others of less merit, or even worthless kinds, you might wonder how I, who ought to know just a little about azaleas, having imported and grown them for more than twenty years, should be such a blankety blank fool as to grow a number of such varieties, as are least desirable. Well, the fact of the matter is that it matters but little what sorts you may order. Those fellows on the other side of the salt pond will send you just such kinds as may happen to be plentiful with them. If you should remonstrate with them, they will tell you with that suave and gentlemanly manner peculiarly their own, 'Why, my dear sir, we are substituting sorts that are far more valuable than the ones you ordered. These sorts are quite the rage here in Europe, you can't afford to be behind the times. It is not your money we are after but we are looking after your own interests. If your people don't appreciate a good thing when they see it, you must educate them up to it.' Oh a fine lot of missionaries they are but I am such an old heathen that I have not been converted yet to their way of thinking. I think," adds Mr. D. with a merry twinkle in his eye, "I shall teach my dog a new trick. I bet he'll know the meaning of 'Azalea' next summer."

There are several houses of callas and Harrisii in pots, also for Easter trade, besides large batches of Spiræa Japonica and Deutzia gracilis.

Staphylea colchica is a new thing with us. We have never seen it forced here before. There is but one plant of it in bloom but it is a beautiful thing. This shrub in habit resembles the lilac and can be forced just as easily. The flower trusses also resemble lilac somewhat but the florets are larger, white with light yellow throat. We counted a dozen sprays on the plant, the size of lilacs we generally import. This ought to find a good market, but can not be sold cheap, as the plant is quite expensive.

A range of houses is also devoted to cut flowers. Prominent among these are several which are devoted to Jacques and hybrids. None are in bloom yet but all are doing well. One house of Jacques in particular caught our attention. The stock is grown in solid beds. The canes, sharply tied down to the ground, broke so evenly that not a vacant spot the size of a dollar can be found on the bed, and every lead is set with bud. The growth too is so remarkably even that apparently there is not an inch difference in length. "I had quite an experience with this house," remarks Mr. Dressell, "you see I have tried in various years to bring in a lot of Jacques for Christmas but never succeeded. I had about given up trying, still as this house ripened up early last fall, and the canes were exceptionally strong, I was tempted to try it again. Well, it didn't take me very long to find out that failure was inevitable. The plants broke unevenly, the growth was weak, so I concluded to call a halt. I gradually withdrew the heat and let the house freeze up again. Quite a risky experiment, you will say. Perhaps. But there you have the result.

In teas there is a good house of Meteors. This rose has always been grown successfully here. The house is not kept as warm as most growers would advocate; 65° is the mean temperature. Mr. D. thinks that syringing with hot water is very beneficial to this variety. The water used is almost scalding hot but the plants certainly thrive under this treatment."

Mr. S. Pearce owns and operates the

old original establishment of Mr. Dressell on Clybourn Ave. The place has been a landmark to old florists for many years, but little remains to remind us of olden times. The place has gradually been rebuilt in a modern way and the old brick flue has given way to the steam and hot water boiler.

Here too we find a good stock of pot roses for Easter and spring trade. Also a large and very fine lot of azaleas. Part of this stock is farther advanced and quite a number of plants are finely in bloom. No large plants are imported since there is little or no demand for large specimens. "Plants that retail for from $2 to $3 each are the best sizes to grow," remarks Mr. Pearce. "I have tried more expensive ones but found no sale for them."

A fine lot of Harrisii in 5-inch pots will make ideal plants for the Easter trade. The plants are grown stocky, of just the right height, and well furnished with foliage from the pot up.

We note also a fine batch of Dutch hyacinths with strong blooms.

Mr. Jurgens is one of the boys who wishes he hadn't. But since he is long on bulbs he tries to make the best of it. Bulbous stuff has been Mr. Jurgens' specialty for a number of years. He was the first in our city who grew lily of the valley in summer from cold storage pips. Last year he lost a good many thousand pips through carelessness of warehouse men, so this year Mr. J. has built himself an ice vault and will care for his stock himself. A batch of valley now in bloom is very fine. Tulips on the other hand are rather disappointing. His stock forces badly this year. The bulbs, though of extra large size, come very uneven and show many weak and crippled flowers. Yellow Prince is the best and we note some very fine blooms. Tournesols are just coming in now but are not at their best yet. Some of the later showy varieties are now brought in for forcing, and we expect to see some fine tulips shortly.

Geo. Klehm is keeping the boys guessing again this winter. How does he do it? is the conundrum propounded. Well we must confess that we don't know, but there is not the least doubt that George does. At any rate he gets there. We refer to his La Reine tulips, or Queen Victoria as some call it. It takes an expert to tell though whether it be La Reine or some other pink sort. It is of course no trick at all to produce this variety at this time of year at least, with more or less of a pink tinge, but in his flowers it is not a question of a mere shade of pink, it is so pronounced, so deep and rich, diffused all over the flowers, as to render it a quite distinct pink variety. And it is not alone the color, but the flowers are fully one-third larger than those from the same stock as grown elsewhere. And then the shape of the bloom even is changed, the flowers being considerable longer and more pointed at top. There is no question of its being the true La Reine. We positively know the stock to be imported from a well known European house that is sending the same kind of bulbs all over this country and yet so far as we know none of them have ever been grown as these are. Flint Kennicott advances an idea, which might be looked into by some of the interested brethren. He reasons thus. You know that George makes several hogsheads of wine every year. Now you know that if you moisten your system repeatedly with grape juice you will produce a fine color in your face. Why shouldn't it do the same to a tulip? H.

A Nematode Disease of the Carnation.

BY PROF. WM. TRELEASE.

[*Read before the American Carnation Society at Indianapolis, Feb. 21, 1894.*]

It seems as though in proportion to the importance attached to a cultivated plant the number and variety of its diseases increase. The excellent papers by Professor Atkinson* and Professor Halsted† on the diseases of the carnation, read before the American Carnation Society, show that they are more numerous than most persons would have supposed, and yet it is probable that these papers are far from exhausting the subject. At the January meeting of the St. Louis Florists' Club, in the course of a discussion on the carnation and the difficulties of growing it Mr. A. G. Fehr of Belleville, Ill., stated that the dying on one side of the plant which he and other members of the club had found frequent and destructive about St. Louis was accompanied, so far as his observation went, by the occurrence of galls on the roots. This was so suggestive of the work of the root nematode as to prompt a request for specimens, that the subject might be given examination, and I have to thank Mr. Fehr for some excellent specimens showing the appearance of the affected plants and the galls on their roots.

It is stated that the disease manifests itself by a browning and shriveling of the tissues, usually of one side of the plant, progressing from below upward, and resulting in the destruction of the plant. So far as can be seen there is no local cause for this effect. At the base of such plants, however, in Mr. Fehr's experience, small irregular galls, varying from the thickness of the smaller roots up to an eighth or three-sixteenths of an inch in diameter, are always to be found on the roots, usually on thin roots or those of medium thickness. In the specimens sent for examination these galls present the appearance of the healthy root so far as color and surface are concerned. They are of a yellowish white color, but they are easily recognizable, even when very small, from the abrupt swelling which they represent in the root. As they become older they are quite irregular and covered with little nodules. Even the smaller ones are likely to present a certain irregularity of surface, with indication of the early formation of such nodules. On some of the older galls these nodules are found to be replaced by cavities surrounded by a thin, ragged margin and a few others are of an orange color, different from that of the rest of the root, and evidently margined by a thin membrane derived from the root.

One of these nodules, picked out from a young gall by the aid of a needle which is worked in behind it and placed in a drop of water under the microscope, is seen to have a peculiar white color, much clearer than that of the root. In the older galls, where the nodules have not been destroyed, when they are removed in the

A NEMATODE DISEASE OF THE CARNATION (HETERODERA RADICICOLA).

*Printed, with numerous illustrations, in the AMERICAN FLORIST, Feb. 23, 1893, pages 720-728, with errata at page 852.

CARNATION THE STUART AS SHOWN AT THE INDIANAPOLIS MEETING.

same way, they present very much the same appearance, except that their color is an orange yellow and they are generally quite opaque. These nodules represent the females of the root nematode (*Heterodera radicicola*), which is the cause of the gall formation on the roots. Within these females, which occur at all depths in the root, from the center to the surface, from which they may even partly protrude, are to be found eggs measuring about .04 mm. by .110 mm. in all stages of segmentation up to the formation of the larval worm, which lies coiled within the egg membrane and other larvæ which have already hatched and lie free within the mother. The characteristic feature of this worm is to be found in the curious metamorphosis of the old female into a quiescent, cyst-like body and her slight resemblance to the male, which after a short time resumes its original activity and then more nearly agrees with the larva and with other nematodes. Migrating from the old cysts from which they have escaped, the young make their way into other roots or other parts of the same root, attacking the young and tender portions, where they give rise to galls similar to those in which they were themselves born.

So far as I know this Heterodera was first noted as occurring in North America by the writer, in the *Country Gentleman* for 1885, when it was reported as causing galls on the roots of the clematis. It has long been known in Europe, however, and in South America, and is the cause of serious diseases in a considerable number of cultivated plants, among others the coffee. A closely related, if separable, species is also destructive to the sugar beet in Europe. Within the last few years the root nematode has been made the subject of several important studies in this country, notably a practical, but somewhat erroneous article, embodying the results of field work rather than critical laboratory work, by Neal*, and a very careful paper by Professor Atkinson†, giving a thorough account of the structure and transformations of the creature, and embodying a partial bibliography of the subject and including a list of thirty-six species of plants on which the worm is known to live in Alabama.

The gall disease caused by this nematode is one of the most difficult to control. For open-air cultivation there is hardly any precaution that will enable one to escape the disease, but by rotating the carnation with other plants which are known not to be infested by the nematode it is possible after a period of years to free the soil which has become charged with them. Until this is done replanting carnations is likely simply to invite further attacks. Keeping down weeds and worthless plants is also very desirable, for we have here one of the best illustrations of the indirect harm that weeds may do by serving as nurses for the parasites of important cultivated plants. Compost is also pointed out by Professor Atkinson as being a source of danger, if it contains roots affected by the nematode, but on the authority of Kuhn he states that this danger may be avoided by placing unslacked lime in layers with the refuse of infected plants used in making the compost. It might be well to note here that Mr. Fehr stated during the discussion which prompted this investigation that he first observed the disease at his own place in some carnations that had been rather heavily fertilized with raw hen manure, which may perhaps have introduced them, although it is by no means clear how this could have been.

Within the greenhouse the problem is a much simpler one, and there seems no reason why this nematode disease should ever be particularly troublesome there if care is taken to propagate from sound stock, since sterilization of the soil by heat will be quite effective in preventing their introduction through either earth or compost. In the AMERICAN FLORIST for September 28, 1893, p. 171, is described a sterilizing vat used by Mr. W. N. Rudd of Mount Greenwood, Ill., for sterilizing all earth used in the extensive greenhouses under his care, the sterilization being effected by steam from the heating boilers carried by a suitable system of pipes through the tank in which the earth is placed, and heated up to the point of the destruction of all vegetable and animal life.

The accompanying figures show the base of a plant with root galls, natural size, a fragment of root with several galls, enlarged two diameters, a free nematode, the tail of a second and three eggs, two of them in process of segmentation, all enlarged 200 diameters.

On the occasion of the presentation of the foregoing notes to the Florists' Club of St. Louis at its February meeting Mr. F. J. Fillmore placed in my hands specimens from his carnation house, illustrating the dying back as he has observed it. These specimens were quite free from galls, but were suffering from the bacteria disease described in the papers above referred to, from which it may be inferred that under the head of dying back the ordinary cultivator may include at least these two very different diseases. Mr. Robert F. Tesson tells me that for the nematode galls of rose roots * freely watering the plants is helpful.

Carbolic Acid for Carnation Rust.

Among the different remedies for carnation rust mentioned in the AMERICAN FLORIST we have not noticed anyone as using carbolic acid as a preventive. We have used the acid this winter and have found it quite as effective as the copper solutions, and it is much more quickly prepared and applied. We use about three teaspoonfuls to a bucket of water and apply it with a syringe.

Galion, O. J. A. TRACHT & SON.

Foreign Notes.

A correspondent of the *London Garden* recently makes note of carnation Tidal Wave, which he had received from a friend in Canada. He particularly commends it for its good habit, freedom of bloom, and well-formed, non-bursting flowers.

A distinct new hybrid cypripedium, recently certificated at Manchester is C. Fairieano-Lawrenceanum. It is a cross between the two varieties from which it derives its compound name. The shape is suggestive of Fairieanum, with a dorsal sepal like Lawrenceanum; colors purple, bronze, green and white.

One of the most remarkable orchid hybrids ever raised is a cross between Lælia elegans and Sophronitis grandiflora. The plant is small, neat in growth, and bearing at the apex of the pseudo-bulb a well-shaped flower of brilliant carmine-rose with a slight tint of orange; the lip is deep crimson with a suffusion of orange in the throat. The plant has been named Sophro-Cattleya Veitchii.

A highly ornamental new musa is M. annaatiaca, distinguished by its brilliant orange bracts and flowers. It belongs to the non-edible section, and is closely allied to M. coccinea. The leaves are bright green, 2½ to 3 feet long; spike dense, under one foot long, bracts and calyx bright yellow. It is a native of Upper Assam, and has been flowered for the first time in cultivation at Hanover.

A comparatively new palm, very distinct and ornamental, is Phopoloblaste hexandra. When young it is as graceful and serviceable as Cocos Weddelliana, and should be valuable for decorative purposes.

Seasonable Hints.

The show pelargoniums that you have been keeping cool and rather dry for the past two or three months will now begin to feel the increased rays of the sun, and show signs of making a more active growth. Now is the time to shift them from a 4-inch pot, in which they have been wintered and be given a 5-or 6 inch, according to the size of the plant. If any of them have made a growth sufficient to give a good strong cutting without robbing the plant too much you can increase your stock, and the cuttings taken off will make good plants, either for market or your own supply of that variety. Remember pelargoniums want a good firm soil. When in their flowering pots they should at least be given a crock and piece of green moss, for drainage. They must at all times be in a house where constant fumigating is going on, for no plant is a greater favorite with green fly than these.

Don't throw away your pan or flat of canna seed because only a few have come and you think the rest of the seed is useless. Pot off all those a few inches high, but keep the seed pan warm and moist and they will continue to come up for months.

You should endeavor to put in the cutting bed just now as large a batch of coleus and achyranthus cuttings as possible, for from these cuttings you will get your fine large 4-inch pot plants for vases, veranda boxes, etc. Much later than this date will do for the bedding plant size, but for good big plants it is time to have them propagated.

We are having very changeable weather and no doubt will have, and as the sun gets more powerful look out for your pansy frames. If frozen tight all right, but on all days when the glass is not covered with snow and the thermometer goes above the freezing point, have the sashes raised a few inches, or they will get a premature start and suffer from severe freezing, which we are bound yet to have.

If any—or too many of your azaleas—show that they are coming into bloom too early for Easter don't forget that Azalea indica will stand a very low temperature, that is anything above freezing. If you have such a place you can retard them several weeks, and not the slightest harm will be done. Don't trust that you will get all your lilies in at Easter without a great amount of maneuvering. They will not be all in at the right time, even under the same conditions, and therefore continual watching, changing round, and good judgment must be exercised.

A crop of lilly of the valley is very desirable at Easter, and unless you have a very strong bottom heat you have no time to spare. If your sand has a temperature of 75° and the top heat 55 to 60° you can allow almost thirty days. If it should be fully developed a few days ahead of the date wanted, none the worse, for it greatly improves when cut and placed in water in a cool place for a day or two.

I intended a week earlier than this to give you the dates that my experience has taught me to bring in the different varieties of tulips, hyacinths, etc., for Easter. It is such a movable date that no definite time will answer for every year. Eighteen to twenty days is time enough for such early tulips as Yellow Prince, La Reine, Vermilion Brilliant, Kaiserkroon and in fact any of the early single varieties, and plenty of time for Narcissus Von Sion and Trumpet Major. The double forcing tulips Tournesol, Murillo, Rex Rubrorum, etc., should have had twenty-eight to thirty days to force easily, and I trust you have those in before you read these lines. Dutch hyacinths in pots will require no more than twenty days. Don't give the tulips a bright house and low temperature or they won't be in, and when they are in flower under those conditions it is yet so early in the season that the stems would be too short. A night temperature of 60° and a slight shade is what they want. Let me remind you that for several seasons past tulips have not gone off at Easter as they did some years ago. Many other flowers are preferred at that holiday. Therefor don't force too many. In this latitude after the 25th of March there will be six or seven weeks elapse before there is any spring flowers from outside. As the sun gets higher there is a natural demand for spring flowers, and they bring just as good a price as at Easter.

Don't neglect just now to put in a large batch of cuttings of the double sweet alyssum. It is one of the few white flowering plants we have for baskets, vases, etc., and is indispensable. A mild hotbed is the place to finish them off after you get them into a 3-inch pot. There are few more valuable plants for vases than the several varieties of achyranthus, but large plants are needed, and as they grow much slower and more compact than coleus they should be propagated in quantity at once.

You may have occasion at this crowded time to place lilies, azaleas and other Easter plants on beds of soil; lots of moving has to be done and all sorts of places utilized to get your crops in just right. You all know the ill effects of standing a pot (say a 5 or 6-inch) on soil. The worms in the bed will go for the pot, and drainage is likely to be destroyed. To prevent this and do no harm to either plant or soil cut up some tarred roofing paper into the desired size. The plant will lift clean off at any time and the worms will keep a respectful distance.

WM. SCOTT.

Scale

CARNATION HELEN KELLER AS SHOWN AT THE INDIANAPOLIS MEETING.

Philadelphia.

The February meeting of the Pennsylvania Horticultural Society was quite well attended and every one present seemed greatly interested in the proceedings. That the hall should be rebuilt on its present site is now the settled conviction of the workers of the society, and resolutions offered by Thos. Cartledge requesting the trustees to erect the hall as soon as possible were passed unanimously, and a committee of conference was appointed to wait on them and urge the importance of pushing the work forward as rapidly as possible. In speaking to the resolutions Mr. Cartledge said that he had no doubt that if the matter was properly placed before the members of the society, of which there were now something near a thousand, consisting of many of the wealthiest and most influential people of the city, there would be very little difficulty in raising the necessary funds.

Increasing the membership was suggested as one of the best plans, as it was thought that out of such a large city as Philadelphia the membership could be increased many times if the proper effort

Scale 6 inches.

CARNATION UNCLE JOHN AS SHOWN AT THE INDIANAPOLIS MEETING.

Scale 6 inches.

CARNATION GOLDFINCH AS SHOWN AT THE INDIANAPOLIS MEETING.

was made, particularly could life members be obtained and this would help to increase the building fund very materially. Mr. Battles believed in the membership plan as a great aid; get new blood into the society, keep it up to date, make it progressive, etc., were his ideas and acting on this line he sent to the secretary's desk seven applications for membership which he had secured almost without effort. Others spoke in a like strain and Mr. Craig for the trustees thought that the committee would find them ready and willing to co-operate with the society and consider any feasible plan looking to rebuilding the hall. It was a question of funds with them and they had not seen their way clear to proceed in the matter as with the $33,000 now on hand, insurance money, it would take about $35,000 to $40,000 additional to erect such a building as would meet the requirements of the society and be a source of revenue, instead of an additional burden. John Westcott for the Florists' Club said they would give $1,000 to the building fund.

The schedule for next fall's chrysanthemum show was adopted. The exhibition will be held November 6 to 10th and the only place available being the First Regiment Armory it was decided to secure this building for the show.

One of the most interesting and instructive papers the society has ever had prepared was now read by Mr. Joseph Meehan, the subject being "Trees for city use." It was listened to with great attention and deservedly applauded.

In the discussion which followed Robt. Craig said that he saw no more reason why property owners should plant and care for street trees than they should lay their own sewers, gas pipe or pavements. They should be controlled alike by the city. He spoke of the results accomplished by the commission which has charge of the street trees in Washington, D. C., and suggested that an ordinance should be prepared and offered to councils having this object in view, and on his motion a committee was appointed to draft an ordinance to be brought before the city councils looking to the appointment of a tree commission or other method to effect the desired end. The committee consists of Robt. Craig, Thos. Meehan and Edwin Lonsdale. Mr. Meehan said that if the city trees were to be under the charge of a commission he would perhaps suggest other varieties than those mentioned. In answer to a question as to why he had not mentioned the elm he said that it was because they were so liable to attacks of insects in the built up parts of the cities; in the suburbs they would do all right.

The weather for the past few days has been very cold, the thermometer registering some 25 degrees of frost, the coldest weather experienced this winter.

Roses, particularly the large teas, are now very fine. Mermets and Brides are at their best. Brunners are scarce. Smith & Whitely have some very fine stock and Anderson and La Roche & Stahl are sending in a few. G. Anderson has two large houses which will be in before long. The price is now $5 a doz. Other large roses are also scarce, the supply not being equal to the demand. Prices are about the same as last week.

Carnations are beautiful but seem tired and soon go to sleep. What is the matter with this flower? It does not keep nearly as well as before the holidays. Perfectly fresh flowers, or those guaranteed to be so, will scarcely last two days; in fact those not sold the day received are scarcely salable the next. We see no remedy or thoughts of one in the account of the proceedings of the society at Indianapolis. Mr. Cartledge of Pennock Bros. says that in a box outside their greenhouse on a roof, carnations put in vases of water will keep for a week, while portions of the same stock if placed in the cellar or refrigerator will go to sleep the second day.

A very exciting game of ten pins was played at the club alleys last Thursday evening. There was but a difference of two pins at the end of the match. Messrs. Craig, McLean, Brown and Kennedy, all made over 500 in the three games, G.

Craig's score being 553. Brown captained the winning team. K.

Chicago.

Trade this week has been fairly active. In the retail line business is fully as good as might be expected in the middle of Lent. There are no large weddings or receptions, but the boys are kept busy with dinners and luncheon decorations, and transient trade also is picking up a little. Although business may not be quite up to former seasons, still there is a more cheerful view taken by most of the dealers.

Commission men report an increased shipping demand. Orders of this kind were unusually heavy and greatly helped to clear up the stock.

Roses in most all classes are plentiful and of improved quality; there is no apparent glut of any one variety. In large roses there is still a decided shortage; Beauties are scarce with brisk demand, very few long stemmed flowers are noted. Good long stemmed stock sells readily at $3 a dozen, with a few extra choice at $4, but the great bulk is short stuff selling at from 50 cents to $1. Hybrids are still scarce. A few good Brunners are seen in the market which are mostly shipped in from outside points. The flowers are not up to the standard in size but are of good form and color and with fine long stems. They bring from $3 to $4 a dozen for the best. Some Anna de Diesbach are also noted but only second grade flowers, which bring $2. Jacques are improving. Most of the flowers shipped in now are from plants grown in solid beds and are much firmer and of better quality than those noted before. These bring $1.50. Bridesmaid finds a ready market at $8, but few flowers are offered as most of the growers, who have a stock of this variety are using all the available wood for cuttings. Mermets are coming in very fine and of uniformly good color that is rarely seen in our market. Brides too are good, but La France is hardly up to the standard though here and there a good lot may be noted; $4 is the ruling price for good stock. Woottons go at $3 to $4, and Perles, Gontiers and Niphetos at $2 to $3. Meteor is of much better color but rather small; good stock finds a ready sale at from $5 to $6.

Carnations are plenty and of fairly good quality. Very few of the common sorts go over $1. In fancy, Daybreak sells at $1.50; a few extra good bring $2; Scott about the same.

Bulb stuff of almost every variety is very slow. Daffodils are a perfect drug and can hardly be given away. In Dutch hyacinths only the light lavender shades are in fair demand. Valley can be bought of very good quality at $1.50 to $2 Romans are about the same. Tulips are very slow. Pink grown La Reine and Kaiser Kroon are the only two varieties called for. The former brings $5 and the latter $4. Most of the other sorts go at $3 and less.

Violets still hold their own although the stock that is offered at present is not of very good color. The supply is about equal to the demand. Quotation on extra choice (very scarce) is $1.50, the bulk of the stock selling at $1 to $1.25.

Harrisii are not quite as plenty and have moved up a notch. Some extra good bring $8 though most of the stock is disposed of at from $5 to $6. Callas are plenty and in little or no demand.

There is some very fine mignonette sent in now, mostly of giant varieties and Machet. Good spikes of these flowers find a ready sale at $2.50.

Orchids keep coming in quite freely. There seems to be no trouble to dispose of them, except cypripediums, these last are very slow. Cattleyas, mostly of the Trianæ species bring from 40 to 50 cents each. Some forms of odontoglossum and dendrobium also sell well.

In greens there is little change. Smilax is extremely slow at 8 to 10. Asparagus plumosus is in fair demand. Adiantum is in good supply at $1 to $1.25.

H. Schiller has bought out the retail establishment of T. J. Corbrey at 897 W. Madison street.

Boston.

A slight drop in the price of roses is the only noticeable feature of the cut flower market. Scanty production rather than large demand is responsible for the fact that there is as yet no troublesome overstock of anything excepting perhaps Harrisii lilies and smilax. A suggestion of the approach of Easter is seen in the few candidum lilies beginning to appear, the bunches of pretty English primroses and the genistas which decorate the florists' windows. Otherwise stock is unchanged in character, and prices hold about the same as they were before Ash Wednesday put its damper upon social gayeties. Violets are being worn more generally. They seem to be almost exclusively the favorites for street wear and an enormous quantity of them is disposed of daily with gratifying regularity.

On Saturday, Feb. 24, Mr. Kenneth Finlayson gardener for C. G. Weld, delivered an essay on cinerarias and calceolarias at Horticultural Hall. The weather was extremely cold, the worst day of the season to bring in plants, but Mr. Finlayson had a row of bright cinerarias on the front of the platform with which to illustrate his remarks, and on the exhibition tables was a fine collection of dendrobium blooms, cattleyas, etc., from George McWilliam and various cut flowers from other exhibitors.

Mr. E. S. Converse's estate at Malden is well known for its attractive grounds and fine bedding in the summer. Mr. D. F. Roy is the gardener. At present he has a brilliant display of cinerarias of a very fine strain in one of the houses, and a quantity of healthy calceolarias give promise of a good show of these favorite plants in due time. Palm house, graperies and peach houses all look well and the work of preparing for the thousands of bedding plants required for spring planting has already begun.

Peter Fisher & Co.'s new crimson carnation Jacqueminot has secured the approval of the buyers here and bids fair to become a leading variety in the market. Mr. Fisher reports the advance sale of rooted cuttings as very large.

Mr. John R. Fotheringham, representing Lord & Burnham, has been sojourning at the Hub for a few days.

New York.

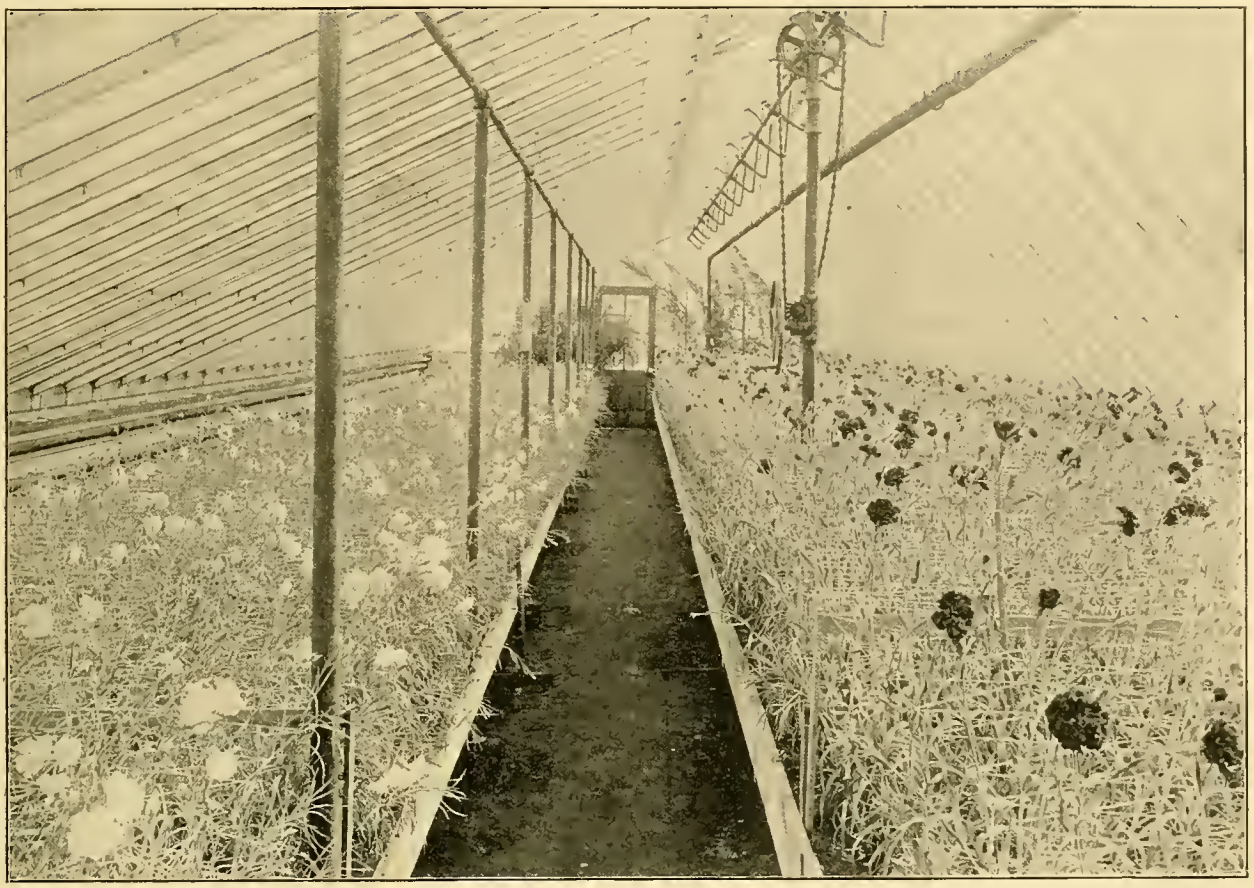
Business has been intermittent during the past week. Some days fairly good, others extremely dull. The Arion Ball and Valentine's Day in the previous week had used up stock on hand and this fact together with the continued dark weather prevented any serious overstock at the beginning of the week. The funeral of Keppler, of *Puck*, furnished a large amount of work for some of the retail florists and called for a large quantity of white flowers. Washington's Birthday was unusually dull, very little special demand on account of the holiday being apparent.

There are a great many poor roses coming to the market. Of American Beauty this is especially true. The proportion of deformed, discolored and short stemmed buds of this variety is very large and number one blooms are few and far between with most of the growers. Ernst Asmus is sending in some good Brunners and from Julius Roehrs are coming Brunners, Magnas and Luizets which are as fine as have ever been seen at this season of the year. A noticable feature of the rose trade this year is the decreased demand for, and the very small quantity grown, of the smaller varieties of tea roses, such as Bon Silene, Niphetos and Gontier. This class of buds seems to have no place in the market to-day.

The carnation growers in this vicinity seem much pleased at the selection of one of their number, Mr. Eugene Dailledouze, as President of the Carnation Society and there is no doubt that he will have the pleasure of leading a very large delegation from this vicinity to the Boston meeting next year.

August Rolker & Sons have succeeded to the business of Robert B. Young & Co. as plant auctioneers at 205 Greenwich St. Mr. Young has been contemplating withdrawing from business for some time on account of continued ill health.

Mr. Wm. Tricker, the well known grower of aquatic plants, has removed from Dongan Hills, New York, to Clifton, N. J., where he has made an alliance with Mr. S. C. Nash under the name of Wm. Tricker & Co. Fine ponds are already located and they propose erecting several houses specially adapted to the growing of aquatics.



The annual spring exhibition of the United States Nurseries will be held from Saturday, March 3rd, to Saturday, March 10th, inclusive. The public are invited and several extra trains will stop at Short Hills during the progress of the exhibition.

Chatterton Bros., florists, have moved from their former location at 5th Ave. and 42nd St., to a larger store on Columbus Ave. near 74th St.

Mr. E. V. Hallock sailed for Europe Wednesday, February 21st, on steamer Majestic.

Washington.

At the last state dinner of the season given by President and Mrs. Cleveland in honor of the Judiciary, the decorations were in scarlet and green. In the state dining room the table, which was in the shape of a Roman I as heretofore, was resplendent with scarlet tulips and asparagus. The centerpiece of scarlet tulips was about three feet in diameter and one foot high. At either side of this was placed oblong plats about four feet long of scarlet tulips on asparagus. Across either end of the table were arranged three round plats two feet through all of red tulips on a base of asparagus. Corsage bouquets of American Beauties were provided for each lady, and a bud of same was at the place of each gentleman. Near the transverse sections of the table were large cut glass bowls heaped with fresh strawberries, carrying out the scarlet effect. The chandeliers were festooned with smilax and the corners of the room were filled with palms and rubber plants. The mantels were banked with scarlet tulips. In the East Room the customary arrangements of palms and decorative plants were lighted by the introduction of tiny red, white and blue electric lights. In the triplet east window the arrangement of plants was surmounted by an electric star in the national colors. The two east mantels in the East

Uncle John, white. *The Stuart*, red.

VIEW IN ONE OF MR. F. DORNER'S CARNATION HOUSES, LAFAYETTE, IND.

Room were banked with hyacinths and Easter lilies with broad curtains of Asparagus plumosus hanging to the floor, the two west mantels being banked with plants. The large space above the entrance to the main corridor was filled with decorative plants, with electric lights in the Union colors. REYNOLDS.

OBITUARY.

JOHN ROSE.

John Rose, the well known florist of Cincinnati, died Feb. 12, of that dread disease consumption. For several years Mr. Rose was foreman for the late F. T. McFadden, whose greenhouses were widely known as the finest in the West, containing as they did one of the finest collections of orchids in America. Last spring Mr. Rose leased the establishment and since then, with the assistance of his foreman, Mr. James Allen, has successfully conducted it. As a grower Mr. Rose had no superiors and few equals. He was the first to grow the grand cyclamens that became celebrated in the trade. He was successful with every plant placed under his charge and seemed to be in perfect touch with all that is best and most beautiful in nature. He loved his plants with a mother's love and gave them a mother's care. At the exhibitions, where he entered, his name always stood high among the prize winners.

As a man he was fair and honest in all his dealings, and never refrained from speaking what he thought. He leaves a wife and three small children to mourn his loss.

John Rose was born in the county of Nairnshire, in Scotland, May 14, 1866. He served his time with his father, who was gardener to Sir George McPherson Grant, at Ballindallock Castle, Banffshire. He arrived in America in 1883 and worked at several places in Newport, also for Mr. David Allan for two and a half years at Mount Auburn, Boston, Mass. He was in charge of Siebrecht & Wadley's orchids for two years, after which he came to Cincinnati as foreman for the late F. T. McFadden.

Appropriate resolutions were passed at a special meeting of the Cin. Florists' Society, and a floral piece was sent to the funeral. E. G. G.

Catalogues Received.

John G. Gardner, Jobstown, N. J., grape vines; Geo. A. Weaver, Newport, R. I., seeds; L. Templin & Sons, Calla, O., plants and seeds; C. E. Allen, Brattleboro, Vt., seeds; E. H. Vick, Rochester, N. Catalogues Wanted.

Wholesale Lists of Plants Bulbs and Seeds.

EMIL LENDON, 147 4th St., Milwaukee, Wis.

FOR SALE—Four greenhouses, of about 4000 square ft. of glass, heated by hot water; about 150 sashes, about 1000 square feet of glass loose in boxes; 800 feet of 4-inch pipes, valves, etc. About 25,000 tuberose bulbs (Pearl). The greenhouses are filled with all kinds of the best selling pot plants to bed out in the spring. Stock in first-class order. Winton Place is a nice suburban residence of Cincinnati. The business is at the Spring Grove Cemetery—it's the largest and prettiest in the state. I am at the C. H. & D. and near the C. W. & B. R. R. station; also street car accommodation. No other florist around. Owner of place will give buyer a lease. Rent reasonable. Reason of selling is because I wish to build upon my own ground (a few miles west of here). Buyer can have possession of place at once. Will sell reasonable, for cash. Also large stock of violets. For particulars address H. SCHLACHTER, Winton Place, Ohio.

FOR EXCHANGE.

A modern apartment building in Hyde Park, Chicago, 40 buildings detached all or part, for a Greenhouse plant to be taken down and shipped or to run wherever located. If location suits, or for nursery stock an equity of $18,000, will assume some or pay difference in cash.

F. N. PERKINS, Kenton, Ohio.

Address THE AMERICAN FLORIST CO., Chicago.

Our Annual Spring Number.

We shall issue our annual spring number March 22. In it we shall publish the first of a series of freely illustrated articles on the arrangement of flowers that will we believe be of very great interest. The articles will deal with the subject exhaustively and cover every detail, beginning with the proper care of the flowers after being cut, then taking up the subject of stemming, describing and illustrating each method, treating particularly on ways of accomplishing results with speed. The arrangement of the various simple designs most generally called for will then be taken up and then the different methods of treating the same subject will be freely illustrated by means of photographs of arrangements put together by the author specially for the purpose. With a given number of the same kind of flowers he will show the various effects that can be created with the same material. These articles will be intensely practical and will start with very elementary instructions, in response to numerous requests from our readers for such primary lessons.

In addition to this feature we will have our usual display of handsome illustrations of seasonable subjects and the title page will be a beautiful design by F. Schuyler Matthews.

Our special numbers need no introduction to advertisers and we may only add that there will be no increase in rates for this special spring number and that copy for advs. should reach us as early as possible and before March 17. A copy of this number will reach every florist in America.

WE HAVE in hand quite a number of communications that we have been unable to give space in the last two issues on account of pressure of other matter. Nearly all of them will appear next issue or the week after.

WHEN SENDING us newspapers containing items you wish us to note please do not fail to distinctly mark the item so it can be easily found, as we can not spare the time to hunt through the mass of papers sent us for unmarked items.

DO YOU WANT an alphabetical list of the chrysanthemums in commerce in America, with class and a brief accurate description of each one, and synonyms noted? You will find such a list in our trade directory and reference book.

DO YOU WANT a list of the leading park superintendents of America? You will find such a list in our trade directory and reference book.

WORK on the directory is being pushed rapidly along and we hope to have books by March 10.

J. B. DEAMUD & CO.

Wholesale Cut Flowers,

45 LAKE STREET.

Chicago, Ill., March 1st, *1894.*

TO CUT FLOWER TRADE,

Dear Sirs:—Owing to the shortness of stock we have been compelled to refuse a great many orders from time to time. We now wish to inform our many friends that we are cutting a very select stock of Roses, such as Brides, Mermets, La France, Albany, Woottons, Mme. Hoste, Perles and Beauties. *Remember that we are Headquarters for American Beauties; growing more than any other grower in the U. S.*

We are now able to supply the above in large quantities, and would be pleased to receive your orders.

Yours very truly,

J. B. DEAMUD & CO.

!!! WE OFFER STRONG, HEALTHY PLANTS OF THE ABOVE FROM 2-INCH POTS.

CORBREY & McKELLAR,

Wholesale and Commission Florists,

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer, 114 Chambers street, New York. Next annual meeting second Tuesday in June, (will probably be held in Toronto.)

Against the Reduction of Duty.

To the Members of the Senate and House of Representatives of the United States:

SIRS:—We, representative Seed Growers and Seed Merchants of the United States, in convention assembled at Philadelphia this 13th day of February, 1894, beg leave to enter our protest against the reduction of the Duty upon Garden Seeds as destructive to the most advanced branch of agriculture.

The late United States Census Report shows that there are in the United States 596 Seed Farms (evidently an incomplete return), with a total of 169,951 acres, 96,500 acres of which are devoted exclusively to the growing of Vegetable and Flower Seeds, while quite one million bushels of selected grains of corn, wheat and oats for seed are sown on other Farms not included in this enumeration.

The report shows that of the 596 Seed Farms 258 are in the North Atlantic Division; 157 are in the North Central Division; 89 are in the South Atlantic Division; 57 are in the South Central Division; 35 are in the Western Division; total, 596.

The value of the Implements used in the culture of the Seed Crops of these Farms is $221,736. The value of the farms, buildings and implements is stated to be $18,325,000. The number of Farm Employes are reported as 13,500 men, 1,540 women, while the number of horses employed is 4,419. Quite 90 per cent. of these farms have come into existence since 1860, but the Seed Farmers now are much depressed by an almost paralyzing competition from England, France, Germany and other countries.

It will be unfortunate if any legislation should be enacted which would further depress this agricultural interest, at once the most scientific, the most technical, the most exhaustive of all farm operations.

The Market Gardeners or Truckers of the United States, men who plant a portion of the seed produced by the American Seed Farmers, cultivate 534,000 acres, producing a value of "Truck" amounting to $76,500,000. Upwards of 100 million dollars are invested in Market Gardening Establishments, while 241,000 hands are employed, aided by 76,000 horses and mules and 10 million dollars worth of Implements.

The successful prosecution of Trucking first of all depends upon the vitality and purity of the Seed produced by the Seed Farmer, consequently any reduction of the American Seed product, unquestionably pure, and more vital than any imported product works a serious injury to the Market Gardener or Trucker who has to plant the seed.

In view of the importance of our business to ourselves and our employes and to the 241,000 people employed upon Truck Farms, we place upon record our protest against the placing of Garden Seeds upon the Free List as provided for under the Wilson Bill. Especially, as no sectional interests are involved and as no persons are objecting to the duty upon Seeds, Congress is not in any way called upon to remove the duty upon Seeds, the present duty of 20 per cent. being simply a revenue duty.

American Seeds of similar kinds to those sent over from Europe are of a better percentage of vitality because of being ripened under better climatic conditions, and because of not having been subjected to the damp and therefore injurious influences of an ocean voyage, but once the European seeds are here they are not sold as of foreign growth, but the less desirable articles, grown by far cheaper labor, are at once priced up just below the price of American productions and placed actively in competition—the result being a breaking down of paying prices for American Seeds and consequently a reduction of farm wages and farm profit.

Such a condition is most decidedly marked in the case of Turnip Seeds, the growing of which by Americans, once an interest of large extent, has almost entirely ceased—the foreign article with the 20 per cent. duty and ocean freight paid being landed ordinarily at a price of 8 cents per pound while an American cannot offer to grow it at less than 12 cents. And so with seeds of Radish, Spinach, Cabbage, and many other seeds. The Wilson Bill now proposes to remove the 20 per cent. duty and make the difference still more to the disadvantage of the American Seed Grower.

Under Free Entry of Garden Seed many more varieties will cease to be grown and many Seed Farmers, the most progressive men in their districts, will be forced to labor in other directions.

While in the ordinary pursuit of agriculture the grower of Hay, will, under the Wilson Bill, have a protection of 33 per cent. against Canadian Hay; 20 per cent against Oats, Barley and Rye; 25 per cent. against Potatoes and 50 per cent. against Rice, the operator in the higher development of agriculture—Seed Growing—the Art of Agriculture—will have no protection whatever.

Consequently we, for ourselves, as Seed growers, merchants and business men, and for our employes, petition that Garden Seeds be retained upon the 20 per cent. list as at present.

MR. H. W. BUCKBEE is now in California.

THE JOHN A. SALZER SEED Co. have in mind a branch house in Philadelphia or New York.

QUITE A QUANTITY of the cauliflower seed shipped from Denmark has been delayed by a steamship accident and likely to be three weeks late, not a fortunate thing for dealers in that seed, needed for early sales.

THIS SEEMS to be a great year for special discounts. One firm offers customers who send them additional orders. 20% additional discount on packet seeds above all catalogue discounts regularly offered. It reminds us of the old days of the plant trade in which the extra and special discounts used to come very near making up the 100% of the cost price and frequently if one side of the order sheet contained paid items, it required the full back page of the list for a list of the extras; will such sad history repeat itself in the seed trade?

Please mention the AMERICAN FLORIST every time you write to an advertiser

ADDRESS **E. B. JENNINGS,**
WHOLESALE PANSY GROWER,
Lock Box 254. SOUTHPORT, CONN.

Montreal.

The Montreal Gardeners' and Florists' Club met and held their first monthly meeting (since the election of officers) on February 13. The principal business was the question of union with the Horticultural Society. The committees of the two societies had met, and presented a scheme by which the arrangement could be carried out with honor and satisfaction to both parties. After a lengthy discussion the subject was left over to another meeting, pending the decision of the directors of the M. H. Society. It was decided to have a social as soon as possible after Easter. I. Perrin read an essay upon "Chrysanthemum culture" which was well received. Considerable discussion ensued, many members desiring to shift all the responsibility for blind wood and stoppage of growth in mums to the "bug." Others, however, were more disposed to let the bug off this time, maintaining that it was owing to our hot dry summer and dry early fall that so much failure resulted in this respect. All, however, were agreed that growing under glass was the only reliable remedy, although good plants and even the best ever grown in this vicinity were grown out of doors last year by Mr. T McHugh.

Another instructive and well written essay upon orchids was read by Mr. I. Holliday, one of our orchid specialists. As the essayist stated, the subject was too broad a one to be disposed of in one short hour. He, however, managed to squeeze into a small amount of paper and time a great deal of practical information. He had especially a good word for the cool section of odontoglossums, which are so difficult to handle with much success in this country, owing to the intense heat of summer and the consequent impossibility of keeping them cool enough. Orchids generally, the essayist thought, would be more largely grown as time went on. They had to be known to be appreciated.

HABITANT.

PREPARE your advs. now for our annual spring number to be issued March 22. It will be a beauty and will go to every florist in America.

OUR trade directory and reference book for 1894 will be issued next month. Send your order now for a copy. Price $2.

PLEASE mention the AMERICAN FLORIST every time you write to an advertiser.

CARNATIONS.

Varieties good. Cuttings good. Lizzie McGowan, Silver Spray, Aurora, Grace Darling, Portia and J. R. Freeman, at $1.25 per 100; $10 per 1000. Fred Dorner, $2.00 per 100; $12.50 per 1000. Daybreak, at $2.50 per 100; $20.00 per 1000. Edna Craig, $3.00 per 100; $25.00 per 1000.

Annie Pixley and Helen Keller.

PIXLEY is one of those beautiful light pinks, with a fair sized flower and good, strong calyx. With ordinary culture stems can be cut twenty inches long. The flower is a model in form, and the growth is strong and healthy.

KELLER you know all about, they are both sure to make good paying varieties for cut flowers.

Pixley per 100, $12 00; per 1000, $100 00.
Keller per 100, $12.00; per 1000, $90.00.

Verbena Lancaster Beauty.

Decidedly the prettiest Verbena that grows, novel as well as beautiful and sells at sight.

Price, per 100, $2.00.

PANSIES.—I can still supply a few of those seedling plants at $5 00 per 1000, or 75 cts. per 100. The same good strain I always have.

No list published and terms are cash before shipping or C. O. D.

Coleus at $7 per 1000. Alternanthera, transplanted, Red, Yellow, Pink, $1.25 per 100; rooted cutting, $6 00 per 1000.

L. B. 496. ALBERT M. HERR, LANCASTER, PA.

EVERYBODY who sees the new and beautiful Fancy Carnation "HELEN KELLER"

are favorably impressed with it, and generally leave an order.

CERTIFICATE OF MERIT

By American Carnation Society at Indianapolis, February 20, 1894. . . .

Orders booked now and filled in rotation, commencing March 15, '91. **Strong Rooted Cuttings, $3.00 per Dozen; $12.00 per Hundred; $90.00 per Thousand.** $2.00 per hundred additional for plants from thumb pots. *Orders may be sent either to*

EDWIN LONSDALE, CHESTNUT HILL, PHILA. or JOHN N. MAY, SUMMIT, N. J.

The Jacqueminot Carnation . .

IS A PERFECT SUBSTITUTE FOR THE JACQUEMINOT ROSE.

Many buy it in preference because of its lasting qualities, and you can have it in bloom when the rose is out of season. Send for descriptive circular, enclose 10c. and we will mail you long stem sample blooms. The color is a bright crimson (no black in it). If the blooms look dull on arrival, they have been chilled or frozen. Notify us, we will ship again.

Rooted Cutting ready now:

PER DOZEN, $2; PER 100, $10; PER 1000, $80. 250 AT 1000 RATE.

ESSEX HEIGHTS FLORAL CO., BELLEVILLE, N. J.

THE YELLOW CARNATION BOUTON D'OR.

After growing this variety for the past three winters we are convinced that it is the best Yellow Carnation ever introduced.

WHAT WE CLAIM:—That it is decidedly a good, strong grower and free bloomer; color a beautiful yellow penciled with dark carmine. That it is of the best form and fully as large as Buttercup. That the calyx is perfect, the stem long and stiff, and the foliage possibly better than that of any other carnation.

PRICE, $2 per doz.; $10 per 100; $75 per 1000. ROOTED CUTTINGS READY MARCH 1, 1894.

Orders filled in strict rotation. Come and see it grow and be convinced. Only one hour from New York City.

SAMUEL J. BUNTING,
Elmwood Ave. and 58th St., PHILADELPHIA, PA.

St. Louis.

Trade for the past week has been good, fine stock of all varieties being scarce, and commanding good prices. Von Sions are in rather short supply, and bring 4 to 5 cents; good Romans are also scarce, some red skin Romans of good quality are being received and go at sight. Good roses are particularly scarce, callas are plentiful and bring 4 to 6 cents, there are enough Harrisiis coming in to supply all demands and the price is 5 cents.

The Chicago wholesale houses have flooded the town with special lists quoting assorted roses at $20 per thousand; several firms are receiving this stock, which in reality is not worth more than is asked for it.

At the regular meeting of the Bowling Club Mr. Harry Young raised the lucky man's score one pin, taking the lead for the present series with a score of 258.

The friends of Mr. James Young are congratulating him upon the addition of a son to his family. R. F. T.

Hollyhock Diseases.

ED. AM. FLORIST: I have read with interest (in your issue of January 25) the remarks of your correspondent B. D. Halstead on hollyhock diseases. I have been a grower of these stately flowers for many years (before double flowers were known) and have had to combat with the various diseases which the whole mallow family is subject to. For some years I have syringed the plants with a weak solution of Per Mangate of Magnesia and can now grow clean, healthy stock. Anyone can try the remedy, as it is neither much trouble nor expense.

JOHN CLARK.

Wemyss Castle Gardens, Fifeshire, Scotland.

THE USE of hardy ferns in floral arrangements and decorations has increased to a remarkable extent of late years. Mr. L. B. Brague of Hinsdale, Mass., was the pioneer in gathering these for market and we learn that during 1893 he gathered and marketed no less than 6,000,000 ferns. He also handles other greens and during the last year he marketed 13,000 Christmas trees, 25,000 yards of wreathing, 600 barrels of moss and 10 tons of bouquet green. He now finds a good demand for baled spruce and balsam branches for cemetery work, and carload orders are not infrequent.

Orange Blossoms.

Sprays 6 inches long, $5.00 per 100 by express. By mail 25 cts. extra.

AMPELOPSIS VEITCHII.

LANGAN BROS., 921 Crescent St., ASTORIA, L. I., N. Y.

Toronto.

The Gardeners' and Florists' Association held its regular monthly meeting last week. The attendance was not so large as usual probably owing to counter attractions. Some say that Peter Jackson was the drawing card but perhaps it would be better to put it down to Henry Irving.

There were several interesting matters brought up which excited lively discussions amongst which was the offer of the "Canadian Horticulturist" to allow two pages as a beginning for floricultural matter to be supplied by members of the association. This paper is now published by the Fruitgrowers' Association and is chiefly devoted to the interests of that industry. The matter was laid over in order to obtain further particulars as to cost to members, etc.

There was also lots of talk over a letter from "a Member" who afterwards turned out to be Mr. Frank Burfitt, asking if something could not be done to stop the cutting of prices and whether a Florists' section of the Association would be agreeable to the members generally. The meeting seemed to favor the idea of a Florists' section and the President appointed a committee (Mr. C. Tidy to be chairman) to examine into the question and report at the next meeting. My own idea is that a Cut flower Exchange is the only panacea that can cure the cutting of prices which it seems to me must of necessity be regulated by the inexorable laws of supply and demand. Whether this city is ripe for such an undertaking and how to start the ball rolling is for the florists to consider.

In spite of the hard times and its being Lent the city has been pretty lively this last week or two. The Governor General, Patti, Henry Irving, the performance of the Greek play "Antigone" by the University students, Peter Jackson, etc., have made the demand for florists' "stuff" a little greater than usual.

The preliminary chrysanthemum show prize list for 1894 will probably be published shortly without the prizes. The amount of money available is not sure yet and it would be a pity to raise the hopes of intending exhibitors only to dash them again. It is thought that a considerably larger sum may be obtained for prizes this year than has been done heretofore. Exhibitors want the list out now in order to know what to grow so something has to be done to relieve the pressure. E.

Our annual spring number, to be issued March 22, will be beautifully illustrated and will be equal to those of the past. Advertisers know what this means. No increase in rates. Send copy for your adv. early so we may have time to get it up in our best style.

AZALEAS FOR EASTER.

WE HAVE HOUSES FULL, AS WILL BE SEEN BY THE ABOVE ILLUSTRATION, OF AZALEAS FOR EASTER FORCING.

The plants are in the best possible condition, finely set with buds, not too far advanced to ship safely at this time, which will insure a supply for Easter. We can make selections of plants taken from different temperatures to give a succession of bloom. We offer plants

9 to 10	inches in diameter at	$ 4.50	per dozen;	$35.00	per 100.
10 to 12	" "	6.00	"	45.00	"
12 to 15	" "	9.00	"	70.00	"
18 to 22	" "	30.00	"		

The varieties we handle are the best market kinds. The 12 to 15 inch size are of exceptional value. Send for copy of **Dreer's Wholesale Price List** for 1894, mailed free to Florists, Market Gardeners and Nurserymen who enclose business cards.

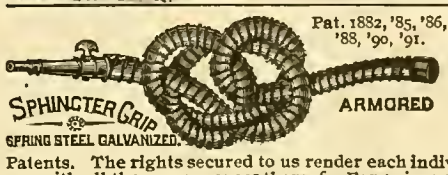
BROTHER
FLORIST!
Aren't you tired going through your houses two or three times a day year after year and lifting your ventilating sash one at a time and propping them up with sticks or pots, with a chance of having sash blown off and broken glass to pay for? If you are



We have got just the thing you need, the **NEWEST** and **BEST** thing out. "The New Departure" for **about half** the cost of the old style. Send for Descriptive Catalogue to
J. D. CARMODY, Evansville, Ind.

R. W. CARMAN, Flushing, L. I.
Dear Sir:—Please send us by Star Union Line Freight (Pennsylvania Line), another 5 gallon can of Little's Antipest. We are not yet out, nor do we want to get out of it, for we think it indispensable and have sent you several customers by recommending it. Please hurry it through.
Very truly yours,
THE GOOD & REESE CO.

BROOKLYN, N. Y., Jan. 15, 1894.
R. W. CARMAN,
Dear Sir:—Please send me 2 gallons of Little's Antipest. Have used your Antipest with great results last season. I was troubled considerably with the large black ants in Greenwood Cemetery, but by using your Antipest drove them all off. Have also used it on all kinds of soft and hard wooded plants, with the best results. I would also suggest to you to send circulars of your Antipest to the different Supt. of cemeteries, also to florists who attend to plots in the cemeteries, as it will save them trouble and annoyances from the black ants who destroy plants and mounds.
Yours truly, CHAS. KROMBACH.

J. C. VAUGHAN, Agent, CHICAGO.

St. Paul, Minn.

"Trade is dull" is heard on every hand. With Lent here and five weeks more till Easter the outlook is not bright. Still sales have been fairly good until Lent, considering the times and we have heard of but little stock going to waste.

Roses are still in moderate demand, white ones especially being quite scarce some days. Carnations and Romans are also in demand. Von Sions seem a drug on the market. Violets hold their own, while lily of the valley sells well, as usual.

Quite a good many Chinese primroses and cinerarias are in the market, the former selling poorly, the latter well. As one of the growers remarked the other day, "I never had finer primroses, but I can't sell them." A few years since they sold readily at 25 cents apiece. Today they cannot be disposed of at half that price.

Some of the department stores have been selling hyacinths and primroses at 8 cents per pot, and quite a few have been disposed of in this manner. Some Easter lilies have also been offered at low prices by the same houses.

One or two of the growers have *rushed* their Harrisii too rapidly and find them now too far advanced to hold for the Easter buyers. Others are rather backward and will require plenty of night heat and warm sunshine to bring into bloom by March 20.

We notice a good many smaller flowering plants being grown for the Easter trade, cinerarias, hyacinths, genistas, geraniums, hydrangeas and azaleas; this latter we consider the ideal plant for Easter and trust that our growers may import this more largely than ever the coming season.

Mr. A. L. Vaughan of Chicago paid us a visit a week since. He reports trade as encouraging and revived the spirits of the florists here not a little. FELIX.

OUR annual spring number, beautifully illustrated and full of valuable matter that will surely be preserved, will be issued March 22. Arrange now for an adv. in it. No increase in rates.

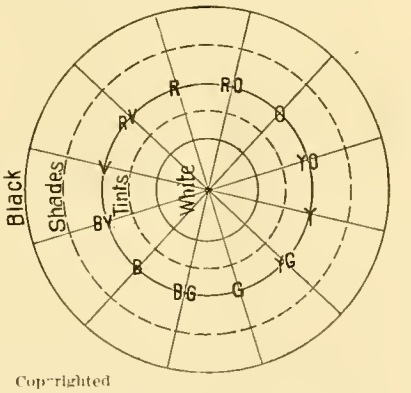
MALDEN, MASS.—A warrant of insolvency has been issued against the estate of Benjamin Grey and his business is in the custody of the sheriff. A meeting of creditors will be held at Cambridge, March 22.

Correction.

In the article on Adiantum Farleyense on page 659 of our issue for Feb. 22 the plant illustrated is described as four "inches" across when it should have read four *feet*. The error was such a palpable one that probably no one was led astray by it, as the illustration thoroughly repudiated such a libel. A 4-inch plant in a 10-inch pot would be quite a humorous combination.

Cincinnati.



For the last two or three days trade seems to have dropped out and flowers of all kinds dropped in. We have never seen better stock.

R. A. Betz, once a designer at the White House, late of the Cincinnati Floral Co., has opened up a store at 294 Vine street. Being well acquainted, we trust Bob will do well. G.

The Law of Color in Flowers.

Why florists are unable to produce blue dahlias, roses and tulips, or yellow asters and verbenas is an interesting problem for consideration. The dearth of literature and exact data make it an obscure question for discussion; but a comparative study of plant life and color will develop many valuable points.

Physicists tell us that light and color are the result of forces acting directly or indirectly through median objects. From this standpoint our problem contains two constant factors, working in harmony; first these curious forces are generated in the same manner, by the sun and ignited bodies, second the constant relationship of conditions in plant life tend to reflect a definite system of colors.

Copyrighted

To show the relationship of these systems I have devised the chromatic staff, based upon spectrum analysis, separating the white sunlight into the following gradation of type colors: red, red-orange, orange, yellow-orange, yellow, yellow-green, green, blue-green, blue, blue-violet, violet and red-violet. The opposite colors, on account of the curious phenomenon of producing a white light with the spectrum, or a gray when the pigments are mixed, are known as the complementary or seventh interval colors. On this framework the circle W represents white, B the spectrum colors in order and C black. Between W and B there is a gradation of tints, and between B and C the shades. The term *interval*, as used in this paper, refers to the intervening spaces between type colors. For example, from yellow to yellow-green is one interval, from green to blue-green is another. They are numbered according to their distance from any given color.

Color pigments of plants are found in two distinct forms. (1) The blue, violet and a few white pigments are dissolved in the cell fluids. (2) The yellow, orange and some red pigments are in granular masses that are protoplasmic in their nature.

Prof. C. E. Bessey, in his book on structural botany, says an alcoholic solution of chlorophyl, or green pigment, can be separated chemically into two distinct powders, yellow and blue. In a private letter he stated that it was the verdict of modern scientists that these two colors were alkaline in their nature, and that the red and violet tints were either acid or contained acid salts. As a result of some chemical process the yellow and blue pigments are separated from the green chlorophyl and developed singly within natural orders. These facts, combined with phenomenal relations of color, have suggested the following law: *Opposite chemical and physical conditions tend to reflect complementary or seventh interval colors.* As this is a new thought we will spend more time in establishing its truth. The chemical composition of pigments is unknown, so the exact change that takes place in color development is obscure; but one fact is conclusively demonstrated, that the three elemental colors, red, yellow and blue, have never appeared in the same natural order. In a single order I found it a universal rule that either the blue or yellow was alone developed through one half of the chromatic staff, or the two remained in their purity without developing into the red. This is exemplified first in asters and clematis, where the blue principle is developed through the red into the complement orange; second, the chrysanthemums, roses and tulips are developed from the yellow through the red into the purple tints. Third, the iris and pansies retain the blue and yellow, but have not been developed into the red.

From these examples it seems to me that there can be two conclusions reached. First, the type colors yellow or blue can only be developed into opposite or acid conditions that would tend to reflect complementary or seventh interval colors. Therefore it will be a hopeless task to work for the third elemental color without destroying the original pigment. Second, in cases where yellow and blue are found in the same natural order it *may be possible* by special cultivation to obtain the red. I found an approximate example of this in a pansy that contained a decided orange-red.

The stamens and pistil contain the yellow pigments that border into orange, green or brown. In a few instances a purple tint is found in the stigma. Seeds, as a rule, are some shade of brown or yellow, with an occasional black or purple.

The same principle is very marked in the fruits. The unripe grapes vary from yellow-green to green; in the ripe stage we have a gradation of gray-violet and red colors prevailing. In apples the variation is from green to red passing through yellow. The ripening of autumn foliage gives a marvellously interesting example

of the change from green into yellow and red.

Development of pigments. Mr. R. L. Blair suggested that the principles of mixing pigments might be applied with advantage in originating valuable and showy flowers. With this thought we made a comparative study of the crossed varieties and found that much blundering work had been done. In many cases parent plants had been selected whose colors, according to the universal law of mixing pigments, would produce clouded and ugly results. In natural orders where the floral colors have been developed from the yellow into the purple, the yellow and red varieties may be crossed with admirable results; also yellow and orange, or white with yellow, red, orange or purple tints. The yellow and purple varieties are liable to combine and give an ugly brown-pink. The reason for this difficulty may be the unlike chemical conditions or the neutralizing effect of complementary colors. In orders developed from the blue type it is best to cross varieties of a pure red and blue. The orange and blue tend to evil results.

In orders where the blue and yellow are both found the yellow and purple shades may be crossed with good results. The rich brown pansy is an admirable example, where the two pigments are mixed in the same cell. From this standpoint I would suggest the following law as a guide: Parent plants should be selected whose flowers are either elemental colors or a dark shade and light tint of the same color.

Prevalency of floral colors: A comparison of the per cents of color found in the spectrum and the relative number of similar colors actually found in nature is valuable in explaining the difficulty of establishing the elemental red, yellow and blue. A writer in the AMERICAN FLORIST in his dilemma and search for pure color says: "Nature abhors the commonplace; she despises crude red, yellow and blue." Nature may abhor these colors, and they may be crude, but there are legitimate and scientific reasons for the limited number of these colors. (1) It is difficult to stop the increasing chemical conditions that would favor a reflection of pure red, yellow or blue. (2) From a table giving the per cents of color in the spectrum it will be found that there are only 54 parts of red, 54 of yellow and 56 parts of pure blue in 1,000 parts of white sunlight; with these two sets of conditions we could not expect to find numerous examples in our flowers.

Between the typical red and yellow there are 334 parts of orange. This and the fact that yellow is the most potent pigment gives a satisfactory reason for the large per cent of floral colors found in this field. Although there is a small per cent of pure yellow in the white sunlight the color is abundantly represented in plants, for two reasons: First, yellow is the most luminous color of the spectrum; second, the pigment granules seem to be less susceptible to chemical changes. The last fact was admirably demonstrated in the samples of corn taken from the cliff dweller's ruins and exhibited at the recent World's Fair. They were almost as bright as specimens grown in later years.

In the table we find 477 parts of yellow-green, green and blue-green, consequently we would expect to find a corresponding number of examples in nature, and are not disappointed. The small per cent of blue found in the spectrum, and the marked susceptibility of the fluid pigments to chemical changes, gives us a satisfactory reason for the limited number of blue flowers. These pigments are found in living tissues, but rapidly disappear in the ripening and decaying processes. The purple and violet tints are more abundant, as they are midway in the stage of chemical development; they are also fugitive colors.

Richness of color: It is a recognized law of physics that light passing through a transparent medium with a reflecting surface beneath will give off shaded colors that are richer. This principle is admirably demonstrated in the physiological structure of the colored portion of plants. The leaves and flowers have one or more layers of transparent epidermal cells through which the light passes. It is then subjected to the absorbing and reflecting processes of the pigments, and made still more beautiful and subdued by the white and gray reflections in the outer cells. The numerous floral tints are caused by an excess of absorption and a feeble reflection of colors that mingle with the white light in the epidermal cells.

It is a universally recognized fact in art that white flowers are a myth. They are all tints of some color depending upon the internal structure, and the nature of the incident light. I might also add that white, on account of the peculiar requirements, should always be regarded as a relative term, and much more difficult to establish than the elemental red, yellow and blue.

Plant markings: In plant markings we have three classes of variegations: First, tints and shades of the same color; second, colors separated by intermediate intervals; third, colors separated by the complementary or seventh interval. Combination of tints and shades of the same color is perhaps the most common class of variegation and is abundantly represented in flowers and foliage of familiar plants. The third, fifth, seventh, ninth and eleventh intervals are frequently found in chord relations. The third class of markings is suggestive of a complete color composition, as it begins with the first and ends with the opposite or complement color. The yellow and purple markings of pansies, asters and iris are fine examples.

I have thus indicated a few laws governing floral colors with the hope that the spirit of original investigation along these lines may be spurred on.

Ames, Iowa. ETTA M. BUDD.

Lady Hume Campbell Violet.

EDITOR AMERICAN FLORIST: I send you by to-day's mail sample bunches of Violets Lady H. Campbell, De Parma and Neapolitan. In an article on Lady H. Campbell violet in your issue of February 8th the writer says, that the color of Lady Campbell and Neapolitan are alike. As I grow the three varieties side by side and under the same conditions, I must say, that I differ with him. With me the color of the Neapolitan is decidedly lighter, while De Parma is about the same color as Campbell, but of slightly different habit and darker foliage.

The stock of the three varieties are all imported from a reliable firm in England, and the Lady Campbell, of which I have stock of two different firms, are exactly alike. The description of L. Campbell in English catalogues seems also to differ. Some give it as "Somewhat like De Parma, but a shade deeper in color," while in others it reads: "Similar to Marie Louise, but larger, finer, and flowers produced more freely." It is possible that there might be a variation in color of the flower if grown in different temperature and soil.

The Lady Campbell has never shown a spot with me, while all the other varieties, such as M. Louise, De Parma, Neapolitan, Duchess of Edinburg, etc., have been more or less diseased.

I do not think that I, or any one else, has ever claimed the color of L. Campbell to be darker than that of M. Louise.

H. HUEBNER.

GROTON, MASS., Feb. 11.

[All the flowers sent were of large size and good color, but we must confess we could not see any appreciable difference in shade between the Lady Campbell and the Neapolitan. There may be a difference, but it was certainly very slight in the flowers when received. Still it may not be fair to judge by flowers that had been shipped a thousand miles. But one thing is certain, Mr. Huebner knows how to grow violets, let the variety be what it may. A large bunch of each sort was sent and every flower was extra good and the foliage as clean as could be wished.—ED.]

With regard to the color of the above violet, opinions are liable to vary just as the color varies with different growers. Last week I visited Mr. Huebner, and with him the color of his flowers is almost as dark as that of the Marie Louise, indeed it would be hard to tell the difference, and many of the flowers could not be covered by a silver dollar, the petals projected all round. These flowers are bringing better prices than any other that are sold in Boston. With many of us however it is not so much a question of color as the fact of being sure of having violets. This was my case and this alone prompted me to speak of the violet a year ago. I have no personal interest whatever in the plant, but simply wish to help others as I have been helped.

In your last issue T. D. Hatfield raises the question of the validity of the variety as sent out by Mr. Huebner, quoting his own as authentic. I have grown the latter as sent me by himself, and there certainly is a difference. His variety failed altogether with me, and was discarded long ago in favor of the variety of Lady Hume Campbell as received from the largest specialist and grower of violets in England by Mr. Huebner. Mr. Hatfield further tells us that the Campbell resembles the Neapolitan. It seems strange that this is necessary when it is so well known that the Campbell is a sport from the Neapolitan and has often been described as such. The color is exactly intermediate between M. Louise and Neapolitan normally, though darker when well done, and as pale as the Neapolitan when not at its best, as late in the season.

With regard to the violet disease, also the carnation rust, it has been said before that the Bordeaux mixture will check the disease if used very early, and this I have found to be so, but as a cure it is of no value especially if the plants be badly affected.

E. O. ORPET.

SO. LANCASTER, MASS., Feb. 10.

Having given this violet a thorough trial the past season I wish to add my testimony to its many valuable qualities, for I believe it is one of the most valued acquisitions of recent years.

Realizing the fact that many have not been successful with the older sorts of late, it is gratifying to know we have one that seems to possess all the desirable qualities looked for in this flower and one that shows such vigorous health. For

Scale
6 Inches.

CARNATION E. A. WOOD AS SHOWN AT THE INDIANAPOLIS MEETING.

size of flowers and profusion of bloom it is unequalled, its perfume is grand, while for length of stems and color it is equally good. No violet in the past has afforded us such satisfactory results and our visitors have spoken in the highest terms of them.

The disseminator of this variety has proved himself a public benefactor.

E. W. BREED.

CLINTON, MASS., Feb. 13.

There have appeared in your paper several communications in reference to the above named violet, and I am satisfied it has not had fair treatment to this time.

I began to grow Marie Louise about fifteen years ago, have seen the Neapolitan grown in many places, and have grown Lady Campbell for the first time the present season, therefore I am able to judge of their comparative merits. I should however say that the Campbell has not had so favorable conditions as the Marie Louise when grown by me, as I had not intended to get the stock until late in the season and did not have a suitable house for them.

The commercial florist does not care about the "deflexity of the leaf foot stalks," or if "the tips of the leaves will turn towards the ground," but, will it sell? does it pay? is it a success?

From the trial of this violet, I consider it a grand variety and wherever I have seen it, and with me it is perfectly healthy, very free of bloom, large full double flower, extremely fragrant and as dark colored as any Marie Louise I ever grew. My experience has led me to believe, that no flower grown by me is so influenced in color, by soil and treatment, as the violet.

For commercial florists it is a decided success: I cannot say for private places as I do not have such an establishment, yet I have seen the Lady Campbell growing at several private places in such fine condition and yielding magnificent bloom that I think the most severe critic would be compelled to acknowledge its excellence.

There is no question but that Mr. Huebner has true stock.

R. T. LOMBARD.

WAYLAND, MASS., Feby. 13, 1894.

Chester County Carnation Society.

The March meeting was held at the society's rooms at Kennett Square, Pa., on Saturday, 3d inst., with an unusually large attendance, particularly of the lady members and wives of members. For the committee on mid-winter exhibition, Mr. Styer reported all arrangements complete for the show to be held at Wanamaker's, 13th and Market streets, Philadelphia, March 9 and 10, all flowers to arrive on afternoon of 8th and be staged that evening.

Mr. Cartledge, of Pennock Bros., will have charge of the staging and decoration, which will be a guarantee of its success. The value of continuing the exhibition for a third day was discussed with the general opinion that if done a renewal of the flowers would be advisable and the growers were instructed to make shipments Wednesday and Friday, the show to be on Thursday, Friday and Saturday. Several letters were read from growers at a distance promising to send flowers for the exhibition. Jos. Phillips urged the importance of making a personal matter of the success of the show and felt that each person should do all he could towards that end. Exhibition cards will be provided on which will be placed the names of variety and grower.

C. J. Pennock and Sec'y Shelmire made reports on the Indianapolis meeting of the American Carnation Society, the former reporting an exceedingly interesting and instructive visit to Mr. Dorner's establishment at La Fayette. Secretary Shelmire reported the gold medal having been bestowed upon "The Stuart," grown by Mr. Dorner. The committee on medal were instructed to have the medal properly engraved and forwarded.

The display of flowers was fine, notably a vase of seedlings from R. Witterstaetter, Cincinnati, O., and P. Fisher & Co., Ellis, Mass. The former included a large and handsome one of Buttercup type and two in the way of Daybreak, also a good scarlet. Fisher & Co. showed Jacqueminot in excellent shape. Others were shown by Messrs. Walton, Larkin, Marshall, Moore, Love, Shelmire and Swayne. Mr. Balderston showed some fine Jack roses and gave some interesting details of his method of culture. A seedling bloom was shown that had been kept over from the February meeting four weeks ago and was still looking well although scarcely salable. It had been kept in the dark with several cuttings of the tip of stem.

E. Swayne in a humorous speech referred to the prophecy of Secretary Shelmire *after* the banquet at Indianapolis and displayed a grotesque dummy carnation which was christened "Shelmire's Dream," or "Great Cæsar's Ghost."

President Ladley asked for information about treatment of tomatoes as a second crop to prevent mildew. C. J. Pennock referred to the annual report of Delaware State Experimental Station which contains hints on tomato growing.

C. J. Pennock spoke of the circular sent out by the Philadelphia Florists' Club soliciting contributions for the entertainment of the S. A. F. and asked for liberal responses from the members.

Miss Baker made a plea for a flower exchange.

C. J.

How Many Flowers From a Plant.

ED. AM. FLORIST: How many blooms per plant per month can La France, Mermets, Brides, Perles, etc., be made to produce under ordinary circumstances?

Also how many blooms per month should each carnation plant produce under average culture? SUBSCRIBER.

The produce of rose plants is rather a conundrum, as, under certain conditions, some varieties will produce much better one season than they will another. A fair approximate estimate of the proportion of such varieties as La France, Mermet, Bride and Bridesmaid, may be taken at four to five buds per month the season round for each plant. For such varieties as Bon Silene, Cusin, Perle, Hoste and some of the other very free blooming varieties a fair approximate estimate would be six to seven and eight flowers per month. This is of course when the plants are in good, healthy, thrifty condition, bearing buds all the time. Possibly this will look a very small estimate to a good many, but I think if they figure it down one year with another and take an average from two to six years they will find it a fair estimate.

With reference to the number of carnations to a plant, that will vary immensely. Take such varieties as Lizzie McGowan from which you will get from seven to ten per month all through the season, while from some others if you get one-half that number, or even one-third of that per month from each plant you may calculate that you are getting a fair proportion of flowers. Then, again, many of the carnations do not bloom in the early months; for the first two or three months of the season they scarcely produce anything, notwithstanding they will produce immense quantities when they once start in,

say January or February, still the loss of count in the early months will very materially reduce their average proportion per month per season for space occupied in the house. JOHN N. MAY.

Plant Notes.

It is doubtless true that the enlargement of a local trade in plants greatly depends on the man who is conducting it, and while experiments are sometimes costly yet it will not do to avoid them altogether, and in the line of experiment some of the following plants may prove useful.

Nerinms: Some of the improved varieties of these plants are greatly superior to the old fashioned oleanders with which we are all familiar, but in order to bring these before the public in such a way as to attract attention, a few plants should be grown on into nice sized flowering specimens, and at the same time working up a stock of young stuff, so that when the large specimens are exhibited the dealer is prepared to furnish young plants to supply the demand that is likely to arise.

These plants are among the easiest to cultivate, for they may be grown in a frame during the summer, and in quite a cool house in the winter, while propagation is also readily accomplished by means of cuttings, the latter rooting quickly in sand with moderate bottom heat, or the cuttings may be placed in water in a warm house, the latter being a very old method for oleander cuttings and quite a successful one.

The varieties are now quite numerous to choose from, for some of the European growers have given much attention to the nerium within the past fifteen or twenty years, but in these experimental operations it is not well to overdo the matter, and three or four good varieties are quite enough to handle.

Among these should be the double white, N. alba plena, this being one of the best; Rose Double, a large flowered variety of a clear deep pink color; Splendens, a bright red double flowered variety; and N. Madonna grandiflora, the latter being a free flowering sort with very large semi-double flowers.

Hydrangeas: A few of the various forms of H. hortensis, in addition to H. Otaksa and H. Thos. Hogg have proved quite salable in some localities, and are no more trouble to grow than the ordinary varieties so largely used for Easter decorations. Of these H. cœrulescens is quite striking, the flower heads being very large and of a very bright blue; and H. stellata fimbriata is another pretty form, having white flowers in moderate sized heads, the individual flowers being prettily fringed around the edges.

The oak-leaved hydrangea is also a nice variety with white flowers, and the red-branched variety is another that is quite attractive.

There is also some demand for the variegated form of H. hortensis as a foliage plant, and it is a really handsome variety when in good condition.

The varieties here noted however, should not be recommended for permanent planting outdoors north of the latitude of Washington, D. C., for they are not reliably hardy, H. paniculata grandiflora being about the only thoroughly hardy hydrangea for northern shrubberies.

Some of the ornamental fruited Solanums, for instance, S. capsicastrum and S. ovigerum make good market plants, from the fact that they are rapid growing, and easy to manage and are quite satisfactory as house plants. These solanums are easily procured from either seeds or cuttings and only require a moderate temperature and plenty of nourishment in order to make a good showing.

Nertera depressa: This pretty little subject has I think been noted before in the FLORIST, but well deserves another reference. It makes such a charming little cushion of foliage, and when nicely grown is abundantly studded over with bright red berries, the berries nestling down among the foliage in such a way that its common name of "Bead plant" seems to be a very appropriate one. Division is the best method to increase this plant, and it may be well grown in a house suitable for geraniums, providing the nertera is given a little protection from the full sunlight. It is also well to take the precaution of not watering this plant overhead during dull weather, as it is sometimes given to damping off under such conditions. W. H. TAPLIN.

Dendrobium Euosmum, and its Varieties, Roseum and Leucopterum.

We have here three hybrids, all raised from Dendrobium endocharis fertilized with the pollen of Dendrobium nobile; all have a charm to which no description could do justice. Their exquisite fragrance, which is not equalled by any other dendrobe, brought forth the remark recently from an amateur orchid enthusiast when visiting here—"There is something about the fragrance of this orchid which appeals to my feelings as no other flower does,"—and the extreme pleasure with which he seemed to extract its odor time and again spoke more eloquently than words; it is indeed a bouquet of odors.

These hybrids were raised by Mr. Seden and flowered in 1885. The seed parent D. endocharis being a chaste hybrid of delicious violet fragrance, the result of a cross between D. Japonicum and D. aureum, therefore euosmum combines all the good qualities of three species. The flowers are not so large as Dendrobium nobile, as the plant is not of such robust habit, but the flowers are more numerous and closer set on the pseudobulb; the type euosmum has sepals and petals white tipped with pale rosy purple as is also the lip, the disc being maroon purple shaded white. The variety roseum is toned all over with rosy purple, which is much deeper at the apex. But of euosmum leucopterum too much cannot be written. The exquisitely formed sepals, petals and lip are snow white, the only coloring being the disc of lip, which is a pale Indian purple. It will be a pleasure when this particular variety gets sufficiently numerous to be within the reach of all orchid growers. It is of comparatively easy culture, the same treatment in every way as recorded to D. nobile being sufficient, only it will require a little extra care in the ripening period.

Dendrobium splendidissimum grandiflorum: This hybrid is supposed to be the same cross as Dendrobium Ainsworthi and Leechianum, but it is much superior in all its parts; in fact so far as I have seen it I consider it the noblest of the Aurea-Nobile crosses. The flowers are nearly four inches across, the whole bloom suffused with rosy mauve, the disc spreading over three parts of the lips of the richest Indian purple and bordered by a pale yellow zone. It requires the same general treatment as nobile, but care should be taken that the plants are not subjected to extremes in ripening the growth, being careful not to allow them to become too dry and shrivel. W. ROBINSON.

Among Chicago Growers.

GROWING CUCUMBERS UNDER GLASS.

George Miller's four houses of cucumbers are well worth a trip to Hinsdale to see. Such luxuriant growth in the cucumber vine we never saw before. Any number of leaves may be noted that measure 12 inches and over in diameter. The variety grown is Rollison's Telegraph.

The first house was planted with plants from 2-inch pots between Dec. 5 to 10. This house is in full bearing at the present writing, March 1. The first fruit was picked and marketed Feby. 16th and averages 16 inches in length, with some 18 inches and over, though larger fruit was grown a little later in the season last year which measured 21 to 22 inches. This variety is an enormous bearer. We counted in several places 15 cucumbers to the square foot. Of course the house will not average the same right through.

The last house was planted a month later, Jany. 11th. This shows fruit from 6 to 12 inches long and promises even better results than the first. This last house is 20 ft. wide and is planted with 4 rows, single vines 2 feet apart in the row. The other three are 11 or 12-foot houses with a walk in the center and bench on either side. One row about a foot inside of the wall of the house on each bench is planted in these. The vines are trained on wires stretched under the roof about 6 inches away from the glass. One imagines he is stepping into an arbor when entering any one of the houses, but look out and don't knock your head against an enormous cucumber. They hang down from the roof in all stages of growth, and remind you of a regiment of policemen's clubs. But don't be afraid of them, they are mighty good eating as we can testify.

Now let us ask George a few questions. We should like to know how he grows his "pets" as he calls them.

"As regards soil" answers Mr. Miller in response to our query, "I take one-half of a good clay loam such as you may find on my place and one-half cow manure. With this compost I fill my beds, drawing up the soil into slightly raised hills two feet apart, into which I plant the vines. I sow my seed in small pots and from these shift onto the benches as soon as the plants are strong enough. I allow but one plant to the hill and let the vine attain a length of 18 or 20 inches, when I begin to pinch them back. The pinching of the vines will have to be attended to constantly. If not you will have plenty of vine, but little fruit. One great advantage in growing this variety is that it sets the fruit without being fertilized, but no seeds are produced without resorting to fertilization, which renders the fruit all the more desirable for the table. The cucumber vine is easily scorched by the hot rays of the sun, and shading has to be applied as early as February. You will notice in one of the houses that some of the leaves look burnt; that is the effect of the sun before the house was shaded. The shading should be very light though; I use lead and linseed oil, which answers my purpose very well.

"Temperature? Well if you can maintain your heat as nearly at 70° as possible you will hit it about right; at any rate the house should never go below 65°.

"Do I feed? Certainly. You might suppose that a compost of ½ manure would be rich enough to grow them in, but I find that the vines can take a good deal more. I use liquid fertilizer in various forms at least twice a week. The result speaks for itself."

CARNATION MME. DIAZ ALBERTINI AS SHOWN AT THE INDIANAPOLIS MEETING.

New York.

Balmy spring weather has come but it has not brought much comfort to the wholesalers and their intimate friends, the growers. The demand has been very light and prices have gone down until now there is actually no price that is stable on anything in the flower line. While a customer may have to pay six or eight cents a piece for roses in dozen lots, when it comes to hundreds one-half of this rate will be gladly accepted and when thousands are handled fifteen dollars per thousand is considered a lucky find.

There is much complaint among the wholesalers regarding the difficulty in making collections. Not all the retailers are slow but those that are slow are very slow and in some cases large amounts are outstanding with nothing tangible in sight on which to base any hopes for future settlement. The method of these parties is to get credit as long as possible at one establishment and when finally pressed for settlement to show virtuous indignation and haughtily transfer their valuable trade to some other concern where they manage to go through the same performance again, and so they keep it up until they have gone through the entire list of wholesalers, with varying success, and when they come to the end there is scarce a wholesale dealer who could not join fervently in the darkey's chorus "Oh, it's hard, it's hard! W'en you don't get you' money w'en it's due." The only effective preventive of this sort of work would be a combination for mutual protection on the part of the wholesalers, but these gentlemen have not yet reached that advanced stage of mutual confidence and harmony and they will probably continue for some time yet as in the past to furnish the working capital for many a soap-bubble enterprize.

Mme. Caroline Testout as seen at Thos. Young's now is entitled to stand in the first rank as a spring rose. Kaiserin Augusta Victoria is also beginning to recover from its midwinter inactivity and some good blooms are coming in. Most of the dealers are receiving Jacqueminots in moderate quantities but there is no special demand for them and they go at small figures. Their greatest effect is seen in the market for Meteors, which have been given the cold shoulder since the Jacqs appeared and have to take their chances now with the "common stuff."

It is said that there is a new crop of fools every year. No doubt the "Bermuda Easter Lily" chaps are counting upon the truth of this proverb, for they are in the market with their circulars and prospectuses in greater numbers than ever. It will be surprising if they will ever realize the cost of the postage stamps. There is but little interest manifested yet by the trade in the cut lily supply for Easter, plants in pots only being considered of sufficient importance to be looked up in advance. From all indications the plant trade will in a greater degree than ever monopolize the larger part of the Easter demand. Julius Roehrs will be in with a large stock of plants. The houses which last fall were a mass of chrysanthemums are now filled with handsome azaleas, rhododendrons, lilies, genistas, hydrangeas, lilacs and metrosideros which are just bursting into bloom. Mr. Roehrs does not confine himself to established favorites but is constantly testing things which are out of the usual order. Tree peonies, Cytisus Andreanum, Staphylea colchica, and several species of prunuses are among the uncommon things to be seen there this year.

Mr. Roehrs is one of the few large growers who continues to force hybrids. Magna Charta, Luizet, Brunner and Rothschild are the varieties grown. Magna Charta is the favorite up to March, after which time it is not considered worth growing. The Luizets are a splendid success this season. They average five flowers to a plant and finer blooms have never been offered in this city. Brunner, Mr. Roehrs asserts, does not pay to force, no matter how fine the blooms may be, as it cannot be counted upon to throw more than one first-class flower to the plant. The large palm houses are made to do double duty, cattleyas being thickly hung from the roofs overhead. There has been an enormous crop of cattleyas there this season and there are plenty to cut yet. An electric road is being constructed connecting Rutherford with Hoboken and will run directly past Mr. Roehrs' place. It will be in operation the coming spring.

A small and very select party paid a visit to Bay Side recently on invitation of Mr. John H. Taylor. After lunch they were escorted through Mr. Taylor's extensive establishment arguing as they went along many an old disputed point, said points being in each case left where they were before, i. e. unsettled. Mr. Ernst Asmus was heard to remark that "it seems to me the more we learn in rose growing the less we know," a sentiment which no one presumed to contradict. To the eel worm question Mr. Taylor gave a new interest by saying, "I don't believe the eel worm is ever in the soil, I believe the man makes it." A house of Hostes which had been carried over a second year was criticised as being an unprofitable investment, and the superiority of young plants was strongly supported, but a set-back was received when Mr. Taylor called attention to a fine house of Brides which he said were four years old, to which Mr. Nash sagely responded "Well, that has a tendency to upset the theory." The Bridesmaids in the new houses built by Mr. Taylor last season are in splendid condition.

A call was made at the Cottage Garden greenhouses and the much-talked-of-short-span-to-the-south houses and their contents examined with interest. Mr. Ward was not at home unfortunately, so the visitors had to pilot themselves. Carnations Wm. Scott and Storm King were in finest health and vigor, the only fault seen in the latter being the distance between the blooms. As to the blooms themselves there can be but one verdict, they are superb. Michigan also came in for much admiration. Mme. Diaz Albertini while most vigorous and strong growing and bearing an enormous flower shows one great fault. The petals bleach out badly and their peculiar twisting gives the flower an appearance of age even when perfectly fresh. Mr. Ward's soil is quite light and sandy.

Mr. C. H. Allen was also visited and was found as always, genial and interesting. He has a fine lot of lilies for Easter but carnations are his main crop. A house of McGowans here may with safety be pronounced equal to anything of its kind in this vicinity. Wm. Scott is also up to its reputation. Edna Craig is badly diseased. Richmond throws a majority of defective blooms and will be discarded.

At Fred Storm's the main crop is American Flag and Portia. In reply to a question Mr. Storm said that Flag brings a small price in the market but it bears well and on this account pays. Here Edna Craig was found to be diseased while Wm. Scott in the same bed with it was perfectly clean. Thos. Cartledge also showed up well. New Jersey was badly bursted and pronounced a failure as seen here. Mr. Storm has one new house with the short span to the south. He remarked that he was well satisfied with it and when building again would build all his houses this way, with a three foot space

and concrete gutters between, to which Mr. Alex Burns responded with a grunt which "spoke volumes."

Chris. Butler's two rose houses at Bay Side are in grand shape. Mermets and Brides are the main crop and the back benches are devoted to Perles of which Mr. Butler says he has cut 15,000 the past season. If Chris. has Mermets, Brides and Perles as good when those houses are old as he has them this year he will come pretty near to beating the record.

The officers of the New York Florist Club held a meeting on March 2 and arranged for a number of very important matters to be brought up at the Club meeting on Monday, March 12. It is of vital moment that every member who can be present should come to the meeting. President O'Mara has made the following appointments for 1894: Executive committee, Messrs. C. H. Allen, Rudolph Asmus, A. L. Don, O. C. Wells and D. H. Roberts; exhibition committee, J. Forstermann, H. W. Wippermann, F. Dressel, E. Asmus (Short Hills), and E. Koffman; essay and publication committee, Sam'l Henshaw, G. W. Hillman and C. H. Joosten.

A. Herrman has leased the entire floor next above that occupied by the Cut Flower Market on East 34th street for a manufactory of metal designs and other florists' supplies. He has put in a set of dies and other machinery for the manufacture of metal foliage and the only material imported is the porcelain flowers, which come from France. The price on these goods has been greatly reduced and very pretty wreaths are now sold as low as $1 each and less. Those costing from 40 cents to $1 are in the largest demand.

Mr. Geo. Paulson of West Hoboken died at his home suddenly on the morning of February 25th. Mr. Paulson has conducted the greenhouses on the Weavertown Road since his father's death about three years ago. He was 39 years of age and leaves a wife and child. A number of florists attended the funeral on Tuesday, Feby. 27th.

On Tuesday afternoon, March 6th, Mr. Samuel Henshaw read a paper before the Farmer's Club at the rooms of the American Institute. His subject was "How to beautify our home grounds."

It is reported that "George the Greek" a prominent member of the street trade fraternity has leased a store on Broadway under the Coleman House.

Julius Roehrs is building a bowling alley which when completed he intends to dedicate in the most approved fashion.

G. Herrmann has issued a very tasty seed catalogue, printed in German throughout, for the benefit of his German trade.

James Purdy has made improvements on his wholesale store in 43d street, among which is a big sign which can be seen a block away.

The greenhouses belonging to Charles Krombach in Brooklyn were badly injured by fire and a fine Easter stock of plants entirely destroyed early on the morning of February 25th. Supposed to be incendiary.

Fire broke out early on the morning of February 24th in one of the large greenhouses of Wm. Boll at Jamaica, L. I. Loss on house and stock about $1,000.

Spring Exhibition of the United States Nurseries.

The annual spring exhibition at Short Hills has come to be looked forward to with much interest by all those who are so fortunate as to be able to attend. This year's show opened on Saturday, March 3d. The great central palm house with its forests of tropical plants and rows of stately tree ferns is made doubly beautiful by two banks of blooming orchids which extend the entire length on both sides, the whole orchid exhibition having been brought from the upper range of houses and concentrated here. There are cattleyas and cypripediums by thousands and in wonderful variety. Odontoglossums are shown in abundance also, many fine forms of O. crispum collected by Mr. Lager being in bloom now for the first time. On the big trunks of the tree ferns Odontoglossums Rossii in large quantity appears perfectly at home, and from the rafters are suspended dendrobiums, nepenthes, etc.

The various houses devoted to cycads, araucarias, ferns, dracænas, etc. are all well worthy of a visit, and many new and interesting species are shown. The seedling cannas, genistas, azaleas and other seasonable blooming plants make a brilliant show and crowds of visitors are expected all through the week.

Flatbush Florists' Bowling Club.

The annual supper of this popular organization was held at Bantel's Hotel on the evening of March 1. There were present besides the resident members of the club Messrs. Alex Burns, John Raynor, E. C. Horan, P. O'Mara, Julius and Theodore Roehrs, J. M. Keller, J. Forstermann, the AMERICAN FLORIST and the *Florists' Exchange*. The early part of the evening was spent in the bowling alley where almost everyone present took a turn at trying to hit the center pin. Small scores were the rule, however, although John Raynor came with an extra supply of muscle and a determination to smash the pins into kindling wood and others were inspired by the promise of a prize for the highest score, said prize proving eventually to be a pair of overshoes which Julius Roehrs had forgotten to take home with him on a previous occasion. But fun was in the air, everybody came for a good time and they got it.

On entering the supper room it was found to be beautifully decorated with laurel festoons and plants and on the table baskets of flowers. The plant decoration was the contribution of Chas. Zeller & Sons and was a most tasty arrangement of palms, lilies, cinerarias, azaleas and vincas. The baskets on the table came from Messrs. Dailledouze Bros., J. Austin Shaw and J. V. Phillips. Mr. Charles Zeller, the president of the club, presided. In welcoming the guests he spoke eloquently of the early days of Flatbush floriculture and of the peculiarly happy fraternal and social relations which had been fostered by the pioneers in the trade here and had been maintained and developed all through the thirty years that have passed since. He advised the young florists of Flatbush to adopt as their policy that of their predecessors and to see to it that harmony, companionship and fraternal feeling should always prevail to the exclusion of jealousy and selfishness. The old gentleman's enthusiastic remarks were uproariously applauded and it was evident that the Flatbush boys are very fond of their president, as they ought to be.

Everybody present was called up for a song, a speech or a recitation, but the speeches were short and indeed it would have taken a man with a great nerve to have attempted a formal speech in such a jolly company. There were quite a number of professedly very modest men present but no excuses were accepted and all had to respond with a word at least. The most noticeable fact was the absolute freedom from any allusion to business or trade matters of any nature, an example which might well be followed all over the country on such occasions, but which unfortunately is not in all cases.

A feature of the evening was the appearance of a magician, a Turk, who proved to be remarkably skillful in his peculiar line and created no end of fun by his manipulations of money, rings, handkerchiefs and mice, Mr. H. Kretschmar being enlisted as an assistant in the pronunciation of the various jaw-breaking phrases necessary to the success of the tricks. J. Austin Shaw read a poetical effusion prepared specially for the occasion, every verse containing some side-splitting local hit, and the very difficult feat of making rhymes for the names of all the members being successfully accomplished.

The illness of Mr. P. B. Meissner was alluded to and his health was proposed and drank standing. After the first restraint had begun to wear off, Mr. Forsterman discovered a piano in the corner of the room. That settled matters. Until far past the midnight hour chorus followed chorus and dealers in throat lozenges in that vicinity should have reaped a rich harvest on the following day.

Philadelphia.

Something in the nature of a sensation has been sprung upon the town in the statement that the large retail dry goods establishment of John Wanamaker is about to open a cut flower department. The air has been full of rumors for the past few days such as: "They would buy flowers in large quantities, get them cheap and sell without profit, and use the department simply as an advertisement"; "they were to sell loose flowers only, nothing made up"; "they were going to do a general florists' business, solicit trade, work cheap and smash things generally"; "they were going largely into plants and would play hob with the Easter trade," etc., etc. The statement has often been made that such a department was to be opened at this place and quite a number of florists and others have made overtures to the firm to rent space or sell and give a commission, but never with any success. Now, however, it is to be taken in hand by the firm and managed by Mr. Weber, the head of the millinery department. The flower stand or counter will be placed in the arcade or main entrance from Chestnut street, through which passes about 10,000 people an hour during the busy part of the day; 1,600 dozen artificial roses of one kind were sold there in a very short time by displaying them on tables, and the manager thinks a like success will attend his efforts in the cut flower line. A Phila. florist is to be in charge. Who is he? The department will only open for the present on Saturdays, when, if it proves successful, a full line of flowers each day and a general cut flower business will follow.

The effect this competition will have in the trade is discussed freely. Some see nothing to be alarmed about, others think it means a revolution of the business, as if it is successful other large combination stores will be compelled to open similar departments, and the retailer will then be pushed to the wall, as they can undersell him and make a profit on prices that it would be impossible for him to meet. Others think that the trade will

Scale
6 Inches.

CARNATION WILLIAM SCOTT AS SHOWN AT THE INDIANAPOLIS MEETING.

be mostly in loose flowers that can be had in quantity and sold cheap, and that this will have no more effect than the street fakirs of the present day. The manager says he has received numerous letters from growers and wholesale men who desire to supply flowers and plants. He says they do not intend to handle plants, as they are so easily damaged and difficult to deliver.

The carnation show of the Chester County Carnation Society is to be held at Wanamaker's in one of their special exhibition rooms in the third story of the building, so that these flowers will be quite high for a day or two at least.

Business for the past few days has been fair. The week opened with almost a blizzard and closed on Saturday with a lovely, balmy spring day, which brought the people out in droves and kept the boys hustling all day long. It was the busiest day of the Lenten season.

Flowers are plentiful, with a tendency to lower prices, although all good stock seems to go readily at the top figures; $6 to $8 is the ruling price for all the large teas, while the smaller stock moves lively at $3 to $4; Brunners are now to be had in quantity and the quality is A1; Anderson has two large houses and could almost supply the market himself for the next month, while Smith & Whitely, La Roche & Stahl, Burton, Heacock and others have now or will soon be cutting this rose; $5 per dozen is the price for good stock; how long it will stand when all hands begin their bombarding is a question. Burton has a few Baroness and is also cutting some of the finest Mermets ever seen in this market. Romans are very plentiful at from 1 to 2, valley 2 to 3, daffys 3 to 4. Carnations are plenty and sell from 75 cents to $1.50 for the best ordinary and 2 to 4 for the fancies.

The fakirs are generally accused of getting their stock at rock bottom figures, their stand being the last station next the dump, but even this record has been broken, as last Friday some of the fraternity tapped "Sam" Pennock's large icebox in the middle of the night and made off with a lot of Beauties, valley and other stock. They found the street door no obstacle and when inside there being nobody on guard except the carnations they had an easy time of it, as these worthies were all fast asleep. Sammy thinks he has his eye on the culprits.

Easter stock promises to be very fine. It would seem as if there will be plenty of lilies and of excellent quality. Messrs. Harris, Craig, Becker, Anderson, Griffin Bros. and Ball all have fine stock; some of it has never been done better. Hydrangeas, too, seem as if they would be very fine. Harris, Anderson, Becker and Griffin Bros. have fine stocks of this plant. There will also be a great many azaleas. Harris has the genista market to himself and grows this plant in all sizes to perfection. All the growers seem to be satisfied with the outlook and say they have booked orders as freely as in other seasons and at about the old prices, except for lilies, for which no one is asking more than ten, or at the most 12 cents per flower, and no charge for the plant. With everything else propitious it is to be hoped that "Old Prob" will do his best and help make Easter of 1894 a record breaker. K.

Chicago.

Continued warm weather and bright sunny days have greatly added to the abundance of stock. With the advent of fine weather the fakir too, is opening up in full blown glory. Every available street corner in the downtown district is adorned by him. The Greek from the standpoint of the legitimate dealer is regarded as a great nuisance, but to the grower and commissionman he is not an unmixed evil. A great deal of second class stock undoubtedly finds an outlet through his agency.

Stock of all kinds is very plenty. Beauties to be sure are getting shorter and shorter, but as hybrids are coming in more freely we do not feel the want of them so much as formerly. In hybrids Brunner takes the lead; some very fine blooms are noted on the Exchange; they bring all the way from $2 to $4 per doz.

Stielow is cutting some fair Diesbach and Laings, but the foliage is badly shriveled. "Carboline" is undoubtedly a good wood preserver but as regards flowers unless you wish to preserve them in a dried state, one has to be careful. Mr. Stielow painted the inside of one of his hybrid houses with this material just before starting the plants. The fumes ruined the foliage entirely although the flowers were not as much injured as at first feared. So if you follow Mr. S's advice, when you use carboline let it dry in thoroughly before putting the plants in the house.

Of the smaller varieties of roses the supply is slightly in excess of demand. As yet no great glut is apparent but if the weather should continue fine prices will probably take a further drop. Nominally such varieties as Mermets, Brides, La France and Albany are held at $4, and Perles, Gontiers and Niphetos at $3, but a great amount is disposed of for much less. Good Meteors rule firm at $4 to $6 according to quality.

Carnations are plenty, and of fair quality. Good long stemmed stock is offered at $1, and fancy at $1.50 to $2. At Corbrey & McKellar's we note some extra fine Tidal Wave. These flowers have been disbudded, cut with stems 12 inches and over in length, and sell readily at $2. Does it pay to disbud? is therefore a question that carnation growers should study.

Violets have taken a decided tumble. For the first time this season the supply is some days in excess of demand. A few good lots still bring $1, but the bulk goes at 50 cents to 75 cents. The bulk of the stock is of rather inferior quality, but J. Meyer and C. Northrup are still picking some very fine blooms. A few bunches of the Lady Campbell variety were seen on the market. As regards color we could not detect the slightest difference between it and the old Neapolitan. Mr. Tonner, who grows this variety in a small way, reports that the plants showed little or no bloom through fall and winter, but bloomed freely towards spring. Mr. T. also thinks that this variety is not subject to disease in the same degree as Marie Louise. He experimented and tried to infect the plants by dropping some diseased leaves from the latter sort among the plants, but no sign of a spot on any leaf has appeared yet.

Little change is noted in bulbous stock. Tulips are of better quality. Kaiser Kroon, Cottage Maid, Crown d'or and Tournesol are fine, but find a slow sale; $3 to $4 are the top figures. Valley, hyacinths and daffs are quoted the same as last week. Harrisii has slowed down again and sells at 4 to 6.

Much speculation is indulged already as regards Easter stuff, but as the matter is generally very capricious at this season of the year, it is rather difficult to figure out the result. If the weather between now and Easter should be at all favorable the cut of lilies will be large, and all other kinds of flowers promise to be plentiful.

Corbrey & McKellar will leave the Exchange shortly and remove to their new quarters on the second floor of No. 66 Wabash Ave. The increasing business of this firm made this move necessary. Mr. Corbrey, the senior partner of the firm, having severed his connection with the retail and greenhouse business, will devote his whole time and energy to the commission trade.

Mr. George Piepgrass, for many years connected with M. Olsen, now Olsen & Hughes, will open up a commission business on the second floor of the same build-

ing, No. 66 Wabash. George has a large acquaintance and is a general favorite with the retail boys, and will undoubtedly make a go of it.

Mr. Wm. Hamilton, of Allegheny City, Pa., spent a few days in the city last week.

O. J. Friedman opened up his branch store at 105 State street last Monday, with a fine stock of flowers.

Ottawa, Canada.

It has been generally admitted by people who know that there are more gardeners and florists, horticulturists and arboriculturists to the square mile in Ottawa, and within the radius of an extended vicinity of Canada's capital city than anywhere else on top of this mundane sphere of ours. To begin with, as an instance, there is the vast Governmental Experimental farm of nearly 1 000 acres, where soils, seeds, manures, propagators, results and productions, as well as profits, are calculated to a veritable science, of everything that is worthy of the name of flower, fruit, vegetable, grain or tree. These are all open to public inspection the year round, and the system is doing a vast amount of good.

Ottawa is purely a society city during winter, and more especially while the House of Commons is in session. Then there is a great demand for flowers and decorative table plants—flowering and foliage, vases, baskets and bouquets. The order of the day among the festivities incident to the opening of parliament are Vice Regal receptions in the senate chamber, and at Government House, by Lord Aberdeen and his estimable lady; at-homes, balls, private fashionable receptions in emulation of vice royalty, private parties, weddings and a host of other things of the kind. These functions and ceremonies always make a drain upon the supply of flowers in the city and as a result outside aid has to be called in, principally from Chicago and New York, for the more expensive cut blooms.

This year parliament opens on March 15th by Lord and Lady Aberdeen in person, and as both are passionately fond of flowers, and as it is unusual for parliament to be opened in person of the lady of the Governor-General as well as by His Lordship, a great floral display has been ordered. Here Chicago again comes in. Her ladyship's dress is being made in Paris. The train will be 20 yards long borne by a score of gilt edge pages. The floor of the chamber will be strewed with exotics and her Ladyship has ordered from Chicago an almost unlimited quantity of orchids, and as oncontoglossoms and cypripediums are her favorites, these are likely to be scarce in the so-called Windy City for some months to come. She is a deep admirer of orchids like her Queen and Joe Chamberlain, M. P.

The range of houses at Government House are a source of pleasure to the vice regal household and visitors, but they are much too limited, are not supplied as one would expect and are said to be ill-heated. They are under the management of the popular Mr. James Sorley, ex-president of the Gardeners' and Florists' association of Ottawa, and it may rest assured what is undone is through no fault of Mr. Sorley. He is a fine fellow, getting up in years, but an ardent floriculturist. What he does not know is not worth learning around here, and when Rideau Hall knows him no more it will be hard to fill his place.

The House of Commons nurseries and greenhouses, also the bedding plant department, are under the care of Mr. Nathaniel Robertson, and it may go without saying are in careful hands. He is strong in decorative plants; has a fine show of heaths, azaleas, palms, ferns, dracænas, crotons, etc. After the session is over he will likely be in the market to buy.

The principal retail florists are Ex-Ald. Scrim, who has a fine flower store on Sparks street; and Harry Parks, secretary of the G. and F. club also on Sparks street. Scrim has a magnificent range of extensive houses on Bank street whilst Parks has his houses in the suburb of New Edinburgh. Both are excellent fellows and doing splendid business summer and winter. They are both looking after consignments of seeds just now.

There is a great demand for the auricula in Ottawa district just now. Undoubtedly for bedding purposes the climate may be slightly against its success, but apparently our amateur and professional growers are not in love with the experiment either under glass or otherwise. The same may be said of pansies of which there is not one single correct specimen.

The Ottawa *Free Press* of Friday says there is likely to be trouble among the horticulturists of the city over the appointment of one or two gentlemen to the directorate of the Central Canada Fair Association, the annual meeting of which was held this week. While the meeting was in progress the chairman warmly congratulated the Gardeners' and Florists' club for the great sympathy and interest they had shown in the success of the annual Fair and thanked them for the valuable assistance they had rendered in decorating the horticultural and floral department of the Fair each year. Then the election of the officers and directors took place and one prominent florist of the city declared afterwards that it was all hole and corner work and that the club or a large percentage of it would withdraw future support.

Mr. James Walkins will read another essay on Cacti before the Gardeners' and Florists' association at the next meeting. This will be the fourth paper previous to pamphlet form. M.

St. Louis.

The weather for the past week has been exceptionally warm for this season of the year and has had the effect of opening the stands in Union Market devoted to the sale of blooming plants. Its effect on the shipping trade in plants has not as yet been noticed; the shipping so far this season has been a long way behind that of last year, the principal cause assigned being the cold weather which prevailed until recently and which was felt more or less severely all through the south and west tributary to St. Louis. Should the warm spell continue it will effectually stop the shipping of cut flowers, as it will be impossible to have them arrive in good condition. The market trade does not open as well as could be wished; only about half as much stock can be disposed of as was sold during the corresponding time last year. Cut flower trade still continues fair, there being several affairs during the week that pretty well cleaned stock up. Callas and Harrisii are, however, at present a drug and hard to dispose of.

Florists are all looking forward to Easter and are out after stock for that occasion. Violets are in demand, but no grower likes to accept definite orders for that time, for if the present weather continues much longer the spring crop will be over in short order.

The committee appointed by the Florists' Club to examine into and report upon the advisability of continuing the chrysanthemum show held a meeting during the week. After viewing the matter from various points it was decided to advise the continuing of the show, provided certain arrangements could be had from the Exposition Association which would give the club a greater share in the receipts, and this arrangement will be made one can state almost positively. All interested in growing plants can now buckle down to work, as it was also the unanimous opinion that the prizes will be increased to such an extent as to be worth working for.

The last meeting of the Bowling Club wound up the third series of twelve games that have been played during the winter and was one of the best attended and most enjoyable of all. Mr. Harry Young managed to retain his lead as lucky man with 258 pins to his credit, although at one time the excitement ran high when Mr. C. A. Kuehn promised to lead this record by one pin. Mr. Jules Benecke takes the medal for averages, having an average of 189¼ for twelve games.

Stacius Kehrman, Sr., assignee for the Elleard Floral Co., has issued checks to parties whose claims have been allowed against the firm; the settlement is on the basis of 23%.

The Rissin Floral Co. had quite a scare lately owing to a fire occurring in the premises above their store; there was very little damage done, however, it being principally by water. R. F. T.

Baltimore.

The club had a great meeting Monday night. There has been a committee appointed for the purpose of providing a little music or oratory to enliven the meetings occasionally, and they secured Mr. Chas. Feast for this time. He gave a very enjoyable little program of piano music, beautifully rendered, which won the hearty applause of all. After the instrumental there was a call for vocal music and two members of the committee started out to escort the bashful and retiring members who were supposed to have the gift of song to the piano. Having exhausted arguments and persuasion on one of our heavy weights, they, after a struggle, lifted him bodily from the floor and conveyed him across the hall. All in vain. "You may lead a horse to water, but you can't make him drink." The next attempt, upon a lighter man, resulted more satisfactorily as regards singing, though at as great a cost of muscular exertion. Then the ice was broken, and Herman ("Frenchy") sung the "Marseillaise." Hantske followed with "Wacht am Rhine; and as a grand finale all joined in "Auld Lang Syne" and "Sweet Home." The work of the entertainment committee was voted a great success.

As the next meeting will be election night, steps were taken to make the attendant banquet a success, appointing committees of invitation, etc. The banquet will be held in the building where the club meets, and a full attendance of this club is looked for, the committee in charge having been at great pains to insure a "feast of reason and a flow of soul," as well as the grosser digestibles usually provided.

Trade is not such a howling success as it might be at this season, but there is some consolation in thinking it might be worse, and almost every other trade is at as low an ebb.

Violets are beginning to be somewhat of a glut, wholesalers seeking buyers at thirty cents and at least one retailer selling to all comers at fifty cents per hundred. Callas are very plentiful at seventy-five cents per dozen. Good roses hold their own as yet, but a little more fine weather will bring them down too.

Mr. Jno. Wiedey is not so seriously ill as was first supposed.

Mr. Rob't J. Halliday is at Ocean City.

MACK.

NEW ORLEANS.—The New Orleans Horticultural Society will give its seventh annual exhibition March 29 to April 1 at Washington Artillery Hall. Copies of the premium list may be had on application to the secretary, Mr. Paul Abele, Dufossat and Dryades Sts.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

SITUATION WANTED—By a married man, age 32, one child, in a private or commercial place; 20 years experience as propagator and grower of palms, ferns and general florist stock; or would take charge of gentleman's estate. Southern States preferred. Please state wages. G. STANLEY, Windsor, Alachua Co., Fla.

WANTED—No. 1 man to grow cut flowers, roses, carnations. Address J, care J. C. Vaughan, Chicago.

WANTED—A good rose grower and propagator with knowledge of mushroom culture. State wages. Address CANADA, care of Am. Florist.

WANTED—A single man for palms and ferns; one that can be of occasional use in retail store. Address H. F. HALLE, 548 W. Madison St., Chicago.

WANTED—Greenhouse assistant; young man with some experience and intelligence. State references and wages with board per month. Address Box 353, Middletown, N. Y.

WANTED—Young man who has had at least 2 years experience at greenhouse work. Reference required from last place employed. Address STATION L, Tacony, Phila., Pa.

WANTED—Foreman for commercial place; must be a practical florist, with years of experience as grower in general. Address IRA G. MARVIN, Wilkes-Barre, Pa.

WANTED—A man who is a good rose grower, for a commercial place—married man preferred. Send copy of reference from last place. Address P. CONNELLY, P. O. Box 230, Madison, N. J.

WANTED—Gardener experienced in growing roses, carnations, and general stock of plants. Two houses. Must be good worker, and sober. Good references required. State wages. Address Box 1124, Rockland, Maine.

WANTED—A first-class working foreman to take charge of 20,000 feet of glass, and grow roses, carnations and general stock. Applicants please forward references, and state wages expected. W. L. MORRIS, Des Moines, Iowa.

WANTED—A PARTNER—To join me growing and selling native and foreign hardy ornamentals, to meet the wants of American and foreign customers. Trade already well established and growing. A Christian and a prohibitionist preferred. Must be competent for the business, and free from bad habits. Some capital needed. Guaranteed a first-class opening for the right man. WILFRED A. BROTHERTON, Rochester, Mich.

TO LEASE—Hot-house in Brooklyn, 15 minutes from New York City ferries, 20x200 feet. Good light and heat. Ample grounds. Address E T F, 316 West 23rd St., New York.

FOR SALE—One Kroeschell hot water boiler 4x12; 4 years in use. Also about 4000 feet 4-inch pipe. ART FLORAL CO., 3911 Cottage Grove Ave., Chicago.

FOR SALE—Four greenhouses, well stocked, with very valuable piece of ground, reason for selling old age. Address WM. SPRINGBORN, Dubuque, Ia.

FOR SALE—Seed business; one of the finest locations in large city. Stock light. A dead bargain to cash buyer. Address B, care American Florist, Chicago.

FOR SALE—The fine greenhouse property on Doan St., Glenville, Ohio; 4 miles from the center of the city of Cleveland, O. A great bargain to quick buyer. DAVID MORISON, 87 Public Square, Cleveland, O.

FOR SALE—Best opportunity to make money ever offered. A first-class florist establishment, and the only one in one of the best college cities, with over 6,000 wealthy people. Splendid cut flower trade all the year. Everything new, with big stock of plants for spring sale. Write for particulars at once. Don't miss this chance. G J, care American Florist.

FOR SALE—Four greenhouses, of about 4000 square ft. of glass, heated by hot water; about 150 sashes, about 1000 square feet of glass loose in boxes; 800 feet of 4-inch pipes, valves, etc. About 25,000 tuberose bulbs (Pearl). The greenhouses are filled with all kinds of the best selling pot plants to bed out in the spring. Stock in first-class order. Winton Place is a nice suburban residence of Cincinnati. The business is at the Spring Grove Cemetery—it's the largest and prettiest in the state. I am at the C. H. & D. and near the C. W. & B. R. R. station; also street car accommodation. No other florist around. Owner of place will give buyer a lease. Rent reasonable. Reason of selling is because I wish to build upon my own ground (a few miles west of here). Buyer can have possession of place at once. Will sell reasonable, for cash. Also large stock of violets. For particulars address H. SCHLACHTER, Winton Place, Ohio.

FOR EXCHANGE.

A modern apartment building in Hyde Park, Chicago, (4) buildings detached all or part, for a Greenhouse plant to be taken down and shipped or to run wherever located, if location suits, or for nursery stock an equity of $18,000, will assume some or pay difference in cash.

F. N. PERKINS, Kenton, Ohio.

When writing to any of the advertisers on this page please mention the American Florist.

Toronto.

An improvement in the plant trade is reported this week which I suppose may be accounted for by the mild weather and thoughts of approaching spring. The street peddlers are able to get out again too with their patent pocket, portable, two-wheel hothouse, and the unwary housekeeper appeared to be catching on to their "all a growin' and a blowin'" wares to a considerable extent.

With reference to keeping cut carnations, discussed at Indianapolis, I may mention that at our last chrysanthemum show we found that they and in fact all the cut flowers kept very much better than in former years by moistening the floor now and then and by heating the hall only to the lowest possible degree compatible with comfort. Most of the carnations were as good on the fourth day of the show as on the first.

J. H. Dunlop is still a firm believer in the short-slope-to-the-south system. The roses in his three houses built last year in that style certainly look wonderfully well and thrifty and have a big crop coming on now, but as a casual observer I cannot say that I could actually see much if any difference between them and those in the old style houses. But Mr. D. says the quality of the blooms is better and that the plants are more prolific.

Staphylea colchica is beginning to be talked about I see. It is a very pretty thing, fine for forcing. I saw it at Transon's nurseries, Orleans, France, 16 years ago, where they were then propagating it very largely. E.

Address THE AMERICAN FLORIST CO., Chicago.

W. K.—The orchid flower you send is a phajus of the grandifolius type.

PREPARE your advs. now for our annual spring number to be issued March 22. It will be a beauty and will go to every florist in America.

ALL ABOUT SWEET PEAS, written by Rev. W. T. Hutchins and published by W. Atlee Burpee & Co., has been revised and enlarged this year. The cultural matter is of much value, and this little book will be found of interest to all growers of this popular flower.

THE Society of Indiana Florists has issued an advance premium list for its eighth annual chrysanthemum show, to be held at Indianapolis November 6 to 10. Copies of the list may be had on application to Wm. G. Berterman, Sec'y, 37 Mass. avenue, Indianapolis, Ind.

THE Idlewild Greenhouse Co., Asheville, N. C., send us a fine bunch of the double white violet. The blooms were of large size and perfect in form. They were as good specimens as we have seen. But we confess we are not partial to white violets. A violet that is not blue has lost one of its principal charms for us.

THE BEAUTIFUL FLOWER GARDEN, by Mr. F. Schuyler Mathews, is one of the most recent horticultural books published by W. Atlee Burpee & Co. Mr. Mathews is well known to readers of the FLORIST by occasional articles on color harmony and taste in decoration. In the little volume now under notice he discusses color effects in the garden, and also has something to say about garden outline, the whole being embellished by numerous illustrations. Cultural directions are added by Mr. A. H. Fewkes, making the book a handy volume for garden amateurs.

WHEN SENDING us newspapers containing items you wish us to note please do not fail to distinctly mark the item so it can be easily found, as we can not spare the time to hunt through the mass of papers sent us for unmarked items.

We have superior facilities for furnishing fresh cut stock, this as all florists know, is of the utmost importance.

Our Roses are unsurpassed, and our prices as low as good stock can be sold. We endeavor at all times to please our customers, and any orders placed in our care will have prompt and careful attention.

OUR MAIN SPECIALTY IS
American Beauties, of which we have the finest stock in the market.

NOTICE TO CUT FLOWER BUYERS.

Our aim is to fill our orders complete at all times, particularly when stock is scarce rather than when there is a glut, as anyone can fill orders when stock is plentiful. Favor us with your trade and we will hustle at all times to fill your orders complete, and with the very best stock the market affords. We always give our buyers the benefit of the market when glutted, in making lowest possible prices, and nothing but selected stock.

All orders by Telegraph, Telephone or Mail given prompt attention, properly filled, and shipped on time.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer, 114 Chambers street, New York. Next annual meeting second Tuesday in June, at Toronto, Ont.

Philadelphia Notes.

TO THE AMERICAN FLORIST:—The enclosed ad. is good enough to insert in your comic column. The *single seed for a dollar* and the whole cargo will especially impress those who are in the trade in a small way:

A GREAT SEED SACRIFICE.

A $10,000 Loss turned to Your Gain.

CHOICEST FLOWER SEEDS come from France and Germany; some rare varieties often bringing *a dollar for a single seed.* A large importing house had an immense shipment of the finest grown seeds ever brought to America, and in unloading at the pier an awful accident occurred Now, as each kind must be put up in small, separate papers, this would have been a complete loss, but, hearing of it, and knowing its value, we bought the *whole cargo* of exquisite flowering seeds, getting in the whole assortment some of the highest cost kinds ever grown. We have thoroughly mixed them, all kinds, and put them up in elegant packets, containing over 200 varieties, to give away as premiums to ———. All you have to do is to sow them in a box, and when they get large enough to transplant you can set them out, and have a most elegant flower garden.

SPECIAL. *Having found a box of* Latest-Craze-in-Chrysanthemum *seed in the lot all safe, we are going to enclose one package of this popular seed also.*

OUR OFFER *is this: To everyone sending us 12 cents for a three months' subscription to ——— we will send perfectly free postpaid these packets of seeds and our* elegant book or manual, *as a guide to the culture of all flowers and plants Its many pages are loaded down with practical hints and helps to everybody, on all sorts of plant life, and describes how to arrange fancy window and garden decoration. We give all of these free if only 12 cents is sent to pay postage and expenses. 6 subscriptions and 6 lots for 60 cents. Address,*

———, *Seed Dept.*, ———, *Maine.*

You kindly ask me for some seed notes, but I regret to say that it is difficult to obtain anything authentic from that source. Up to date the reports are as follows, which is I think a very accurate statement:

For many seedsmen the month of January was the best for years. In some instances the amount of trade was 25% in excess of any previous year. During February, however, trade fell off so rapidly that now, March 1, most of the seed houses are way behind, notwithstanding the fact that one firm especially has done $10,000 to $15,000 more advertising than usual. The falling off has occurred principally in plants and also in flower seeds. From the great number of inquiries, however, it is hoped that business will improve early in March and in April. So far the plantsmen have suffered terribly. It is reported that one of the prominent firms, if not the most prominent one, is not doing one-third the business expected, notwithstanding an enormous outlay in catalogues and advertising. Those who have done the least advertising are coming out best, as big advs. in $3 and $4 per line papers are not pulling at all. It has always seemed to the writer that the seedsmen were dividing a large share of their profits among the high priced magazines. To anyone who takes the trouble to compute the cost of advs. in some of these it seems impossible that the amounts spent in a single issue by some seedsmen will ever come back to them. One shrewd seedsman stated the other day that a $900 adv. returned him just $200, and he is a good advertiser too. I think that some folks will come to the conclusion that full page advs. do not pay. After repeated conversations with several prominent men in the trade we have found that the horticultural magazines pay them best. This is noticeably the case with small dealers.

A. BLANC.

MR. J. A. FRASER, formerly with Currie Bros., Milwaukee, Wis., is now traveling for H. G. Faust & Co., Phila., Pa.

IT IS BELIEVED that more than fifty tons of sweet peas, covering over five hundred acres of ground, will be produced in California this season.

THE Western Seed & Irrigation Co., at Waterloo, Neb., are out with a seed growing circular to the wholesale trade. F. W. Barteldes is president and treasurer, Frank T. Emerson, secretary and general manager.

MARCH 22 we shall issue our annual special spring number. No increase in adv. rates. Send copy early for your spring announcement.

Mention the American Florist when writing to advertisers on this page.

Odontoglossum Krameri Albidum.

A very charming form of Odontoglossum Krameri, with pure white sepals and petals, having the base of the labellum of a bright yellow, and the blade of the lip of a delicate pink, is now in flower with Walter Cobb, Esq., Dulcote, Tunbridge Wells; its beautiful flowers last a long time. But few plants of this white form are known. There is one in the Tring Park collection and Sir Trevor Lawrence has another and that probably enumerates the number in cultivation. "*Viator*" *in Gardeners' Chronicle.*

[Odontoglossum Krameri alba is known in this country and is to be found in certain of our large collections. It is white with yellow crest but the pink lip above mentioned is absent. After all, the white form is hardly equal to the type in beauty, and compared with Alexandræ and Pescatorei, Krameri, Oerstedii and the like must take a back seat. But Krameri and its varieties are liable to be always scarce owing to the great difficulty in handling them.]

Our annual spring number, to be issued March 22, will be beautifully illustrated and will be equal to those of the past. Advertisers know what this means. No increase in rates. Send copy for your adv. early so we may have time to get it up in our best style.

COLEUS.

Our stock is large and handsome, consisting of 70 to 75 varieties, including the very newest kinds.

ROOTED CUTTINGS, in 30 to 40 varieties, (our selection), at $6.50 per 1000 by express; in 20 varieties, at $1.00 per 100 by mail.

NEW KINDS, including some of the most handsome ever offered for sale, in 10 varieties, at $2.00 per 100 by mail.

Golden Verschaffeltii and Mrs. I. O. Haight (yellow), at $8.00 a 1000. *We will include* at least 50 cuttings of the *new kinds* in every 1000 purchased.

CARNATIONS.

A large stock of **BUTTERCUP** in prime condition.
Rooted Cuttings, $5.00 per 100; $10.00 per 1000.
Prices of other kinds on application.

Send for circular. Safe delivery guaranteed in all cases.

W. R. Shelmire,
. . . **AVONDALE, PA.**

The Best Carnation in the Market.

THE ADELAIDE KRESKEN

Which was originated in 1891, and flowered in the same year, is conceded by all to be the prettiest Carnation ever grown. Strong grower, free from rust, is 2 ft. high, stiff stem, good calyx, and the flower (of a beautiful rosy pink color) averaging three inches and over.

A VERY FREE BLOOMER. In addition to receiving the **Best Seedling Prizes** at Cincinnati, O., Club Certificate at Springfield, Mass., and Milwaukee, Wis., Hunt Prize, Indianapolis, Ind., it has received Certificates of Merit at the American Florists' Society St. Louis, Mo.; also the best vase of pinks at St. Louis, Mo., and Certificate of Merit at Toronto. The undersigned begs leave to submit the following exceedingly low prices for **Rooted Cuttings**, which will be ready March 1st 1894: **$2.00 per doz.; $10 per 100; $45 per 500; $80 per 1000.**

Cash must accompany all orders. Address all communications to

50,000 Carnations.

ROOTED CUTTINGS READY.
NO "RUST."

SEND FOR LIST. . . .

Wm. Swayne,
P. O. Box 226. KENNETT SQUARE, PA.

50,000
Rooted Cuttings Carnations,

of standard tested sorts. All healthy.
Send list of your wants.

Address **BENJ. CONNELL,**
Carnation Grower, WEST GROVE, PA.
Also a nice lot of small Ampelopsis Veitchii for potting up, at $20.00 per 1000.

CARNATIONS.

Varieties good. Cuttings good. Lizzie McGowan, Silver Spray, Aurora, Grace Darling, Portia and J. R. Freeman, at $1.25 per 100; $10 per 1000. Fred Dorner, $2.00 per 100; $12.50 per 1000. Daybreak, at $2.50 per 100; $20.00 per 1000. Edna Craig, $3.00 per 100; $25.00 per 1000.

Annie Pixley and Helen Keller.

PIXLEY is one of those beautiful light pinks, with a fair sized flower and good, strong calyx. With ordinary culture stems can be cut twenty inches long. The flower is a model in form, and the growth is strong and healthy.

KELLER you know all about, they are both sure to make good paying varieties for cut flowers.

Pixley per 100, $12.00; per 1000, $100.00.
Keller per 100, $12.00; per 1000, $90.00.

Verbena Lancaster Beauty.

Decidedly the prettiest Verbena that grows, novel as well as beautiful and sells at sight.

Price, per 100, $2.00.

PANSIES.—I can still supply a few of those seedling plants at $5.00 per 1000, or 75 cts. per 100. The same good strain I always have.

No list published and terms are cash before shipping or C. O. D.

Coleus at $7 per 1000. Alternanthera, transplanted, Red, Yellow, Pink, $1.25 per 100; rooted cutting, $6 00 per 1000.

L. B. 496. **ALBERT M. HERR, LANCASTER, PA.**

"HELEN KELLER Is the Finest Variegated Carnation now on the Market."

So declared **THE JUDGES** at the meeting and exhibition of the
AMERICAN CARNATION SOCIETY AT INDIANAPOLIS, FEB. 20, 1894.
And so say all who have seen it **Growing** and **Blooming.**

The delicate tracing of scarlet on its pure white petals renders it very showy; yet does not mar its effectiveness when used on all joyous occasions.

A CERTIFICATE OF MERIT was awarded by the A. C. S. at **Indianapolis**, and
A CERTIFICATE OF MERIT was awarded at **Washington, D. C.** last November.

It is a free and continuous bloomer; in addition to the large size of the flower and its perfect form. **Price for Strong Well Rooted Cuttings, $3.00 per Dozen; $12.00 per 100; 250 for $25.00; $90.00 per 1000.** 500 at 1,000 rate. *Orders may be sent either to*

EDWIN LONSDALE, *CHESTNUT HILL, PHILA.* or **JOHN N. MAY,** *SUMMIT, N. J.*

THE YELLOW CARNATION BOUTON D'OR.

After growing this variety for the past three winters we are convinced that it is the best Yellow Carnation ever introduced.

WHAT WE CLAIM:—That it is decidedly a good, strong grower and free bloomer; color a beautiful yellow penciled with dark carmine. That it is of the best form and fully as large as Buttercup. That the calyx is perfect, the stem long and stiff, and the foliage possibly better than that of any other carnation.

PRICE, $2 per doz.; $10 per 100; $75 per 1000. ROOTED CUTTINGS READY MARCH 1, 1894.

Orders filled in strict rotation. Come and see it grow and be convinced. Only one hour from New York City.

Dailledouze Bros., Flatbush, L. I., N. Y.

Harrisii Lily Splitting.

ED. AM. FLORIST: What is the reason that some of my Harrisii lilies split? I have a very fine looking lot of plants but now they are beginning to bloom a good many of the buds are coming crippled and split when opening. They are in 5-inch pots. The bulbs were 7 to 9 inch and apparently in good condition when potted. Has greenfly anything to do with the trouble? BEGINNER.

The splitting of lilies is not influenced by whether the bulbs are good or bad. If the bulbs were inferior they would show it in the growth. Splitting is occasioned by injury from greenfly when the buds are small, and the injury is usually done before the buds show above the foliage. At that time the buds are very succulent and soft and punctures made by green fly prevent proper development of the flower and cause it to open unequally which occasions the splitting. The flowers of plants kept perfectly free from green fly never split, and they never split from any other cause. No crop is so easily injured, at least none shows the damage so much, as Easter lilies when allowed to become infested with green fly, and they should be looked after very carefully all during growth on this account.

F. R. PIERSON.

H. STEINMETZ, Raleigh, N. C.

Buffalo.

The past week has been bright spring weather here, warm sunny days and mild nights. When the thermometer stands at 62° in the shade on the 4th of March it is liable to upset your calculations for Easter crops.

There has been a great abundance of flowers for the past week or two and on Saturday some ruinous cuts in prices were made. Carnations, violets and daffodils suffered most. When daffodils and carnations are retailed for twenty-five cents per dozen, the grower, whoever he is, is not going to make money enough to take him to Atlantic City this summer.

Business has been fairly good the past week, plants selling well. I never remember so many good houses of violets in this locality as can be found this year.

The club held its monthly meeting last Tuesday, when nomination of officers were in order. They will be an entirely new set and may they put new life into the old organization is the prayer of all of us.

Buffalo florists were glad to be represented at Indianapolis, even if it was *only* by Mr. Long. He gave us a good talk on it. It must have been immensely enjoyable besides instructive.

We have among us the well known "Jim the penman" with his handsome and affable assistant Capt. Foy. They are victimizing a large number of our citizens, but the victims are all getting good value for their money. W. S.

OUR annual spring number, beautifully illustrated and full of valuable matter that will surely be preserved, will be issued March 22. Arrange now for an adv. in it. No increase in rates.

Fenster Pappe, the new German substitute for glass on frames. For detail see our Catalogues. We furnish original Rolls of about 110 yards for $9.00 net cash. Trial Rolls, enough to cover four sashes for $1.00 cash; these latter will travel by express for little cost, weighing below 10 lbs.

Cycas Leaves, (Sago Palm), natural prepared, equal to fresh cut in appearance, according to size at 40c., 45c., 50c., 60c. and 75c. each.

Metal Designs, the best winter cemetery decoration, in rich assortment of tasteful designs: Wreaths, Crosses, Anchors, Hearts, etc., in green or white foliage.

Supplies of all Kinds, such as Immortelles, Cape Flowers, Wheat Sheaves, Flower Baskets, Pot Holders, Plant Stands, Fern Dishes, etc., etc.; all quoted in our beautifully and richly illustrated new Trade List mailed free. Address

TO TAKE PLACE OF WIND MILLS

HOT AIR PUMPING ENGINES

A Windmill

Is unreliable because it depends upon the elements for its power; hydraulic rams also depend upon favorable conditions and waste as much water as they secure. Steam pumps require skill and hand pumps demand labor and time. The

DE LAMATER-RIDER OR DE LAMATER-ERICSSON Hot-Air Pumping Engines

are especially designed for pumping water, and from shallow streams or any kind of well. They are simple, safe and reliable, require no steam and have no valves. They require very little heat to operate them, and can be arranged for any kind of fuel.

FLORAL DESIGNS

The Cut Flower Worker's Friend. Fine book of 160 pages. Send **$3.50** for it, to

J. HORACE McFARLAND, Harrisburg, Pa.

Boston.

There is no very heavy overstock of flowers in this market yet, and although the demand is very light, yet everything is fairly well cleaned up every day. The weather is getting so that the street fakir can expose flowers in the open air, and he is both numerous and industrious. He does his share towards keeping the stock well used up, and the growers would miss him sadly if he should go. The retailers, however, are not inclined favorably towards him, and the old fight to have him removed from this vicinity is showing signs of being renewed with fresh zeal.

There is a good supply of tulips, daffodils and other bulbous stock in pots, and palms, besides quantities of fine azaleas in bloom now in the market. The plant trade, however, is not as brisk as it should be. The supply trade has fallen off considerably during the past two months and is far behind that of last year.

Some of the florists report frankly an unsatisfactory season. Others with as much apparent sincerity claim to have done as well as in the past. Perhaps both are true, the difference resulting from local causes. There is no uncertain or varying testimony from the growers though, for it would be useless for them to claim that results during the past season have been equal to former seasons. Those who grow bulbous stock have suffered the most, for it has in many cases brought barely the original cost of the bulbs. There is a very general complaint regarding collections, which are unusually slow. A good season after Easter is hoped for, as such has been the rule in the past when this festival came early.

IN THE DEATH of Mr. R. J. Halliday, of Baltimore, the trade loses another of those leaders who were such a tower of strength in days gone by. We owe him much for his constant effort in combattiug the tendency to laxity in nomenclature, and the present S. A. F. committee on nomenclature was really the outcome of his early efforts to get the society to take a forcible stand in the matter. He was a member of the society of American Florists from its inception and always took an earnest interest in its work and welfare. A good and true man has gone to his reward.

WHEN SENDING us newspapers containing items you wish us to note please do not fail to distinctly mark the item so it can be easily found, as we can not spare the time to hunt through the mass of papers sent us for unmarked items.

DO YOU WANT an alphabetical list of the chrysanthemums in commerce in America, with class and a brief accurate description of each one, and synonyms noted? You will find such a list in our trade directory and reference book.

NEXT WEEK comes our spring number.

Progress in Orchid Culture.

[Paper read before the Gardeners' and Florists' Club of Boston by Wm. Robinson, gardener to Mrs. F. L. Ames, North Easton, Mass.]

Probably in no department of horticulture has such progress been made as in the culture of orchids. Twenty years ago these plants were cultivated only by the few, and their culture was so obscure that many valuable plants were lost through ignorance of the proper conditions indispensable to their culture, also through the absence of proper information from collectors as to the conditions and surroundings of these plants in their native habitats. Plants at that period were collected at all seasons. They did not regard whether the plant was dormand or in active growth. Their end and aim was to send home as many plants and in as small a compass as possible. Foliage and growth were thus sacrificed to space, and the stately lælias and cattleyas and other evergreen orchids would be sent home mutilated, and would often arrive exhausted and half dead, thus placing the gardeners and growers of that period at a disadvantage.

Everything is now changed. The advances made, not alone in the collecting and shipment of these plants and in the discovery of additional species and varieties, but also in the quantity and quality of the same is something marvellous. Old species which were supposed lost to cultivation have been re-introduced and the collecting of plants has been done with more care and intelligence. Plants now are collected after their growth is completed and matured, and they are now sent home invariably almost intact, with foliage nearly as perfect as when growing in their native element, thus retaining all their fresh vigor and presenting the appearance of established plants, some flowering almost immediately after their arrival.

Cattleya Trianæ was introduced in European gardens in 1860. It was only represented by a few plants, and not until ten or twelve years ago did they become known to the many, when fresh importations were sent to Europe by tens of thousands of plants, thus placing them within the reach in good condition of everyone who had a greenhouse. Many fine forms have appeared from time to time recently, including the saintly white form, C. Trianæ alba, the beautiful feather petalled Backhouseana and the immense Leeana, which is the largest form yet seen and commanded at auction sale about five hundred dollars per growth. I might mention the Dodsoni, which realized over one thousand dollars, and the fine formed Osmani, both of which are still rare, and many other forms, including Reine des Belges, Sanderæ and Amesiana, the latter a deep colored form named two years ago in honor of the late Mr. Ames.

Cattleya Mendelli is another orchid which was introduced to cultivation and was represented by one plant in 1870, but has these past few years been imported in large quantities. This brilliant cattleya resembles Trianæ and comes into flower immediately after that variety in the months of April, May and June, comprising many beautiful varieties, of which the white C. Mendelli Blunti is the most rare, and C. Mendelli Backhouseana is the richest colored form I have yet seen. This cattleya is of easy culture and yields to the same treatment as C. Trianæ, and can be confidently recommended to the consideration of florists. The great mistake many florists make is in going to auction sales and buying the refuse of many markets because they can be procured cheap.

Cattleya Warscewiczi is another cattleya which was only represented by one plant twenty years ago, but has since been introduced in such large quantities as to place it within the reach of all lovers of orchids. Out of all the immense importations which have appeared this seems to be the least variable of the labiata section, differing so slightly. Mr. Robinson here gave a list and interesting description of the more distinct forms of this species and then spoke of Cattleya Gaskelliana, which he said was introduced in 1883 and now is known in several very valuable forms, such as alba, Dellense and virginalis. Cattleya Bowringeana, he said, is another which has been received within the past eight years, and flowers during the months of October, November and December, throwing up large spikes of Skinnerii colored flowers, carrying from twelve to twenty-four flowers to a spike, lasting long in perfection. It is of easy culture and a grand acquisition as an ornamental plant and for florists' use.

The re-introduction of old C. labiata vera after more than half a century and when the locality where it was originally found was supposed to have been obliterated by volcanic disturbances, was an event of great importance to orchid lovers, as it placed within the reach of all this truly grand old species. Four years ago it was valued at three hundred dollars per lead, and today it can be purchased for as many cents. Mr. Linden introduced it as a new species under the name of Warocqueana, but the enthusiastic Sander had his collectors in the field, and it remained for him to announce to the orchid world that he had secured importations of the old original labiata. Everyone be-

ing anxious to procure it, it has been secured through many sources and now can be had for about one dollar. Many fine forms of this wonderful cattleya have appeared, including the white, which of course will remain expensive. It has proven of easy culture, and flowering in the months of October, November and December, makes it valuable and appeals to the florist.

Percivalliana is another recent introduction, distinct as well as beautiful, and in a horticultural sense a valuable addition, flowering in midwinter and almost simultaneous with the early Trianæs. It is variable in color, some forms being paler than others, while some are distinguished by a greater area of rich tawny yellow in the labellum.

Several other fine cattleyas have been introduced these past few years, which at present remain scarce, such as the beautiful white form Rex, the superb natural hybrid Hardyana and the equally brilliant Massiana. These are natural hybrids between C. Dowiana and C. Warscewiczi, and are among the richest colored forms.

The old Cattleya Mossiæ has been reintroduced in quantity and is represented by many fine colored types, but the whites are the most beautiful and have been more especially cultivated these past few years, including Mossiæ alba, Reineckiana, Arnoldiana and Wagneri, the latter snow white with lemon throat, the others white sepals and petals with delicately pencilled lips.

But with the hybrid forms which have been raised within the past twenty years the greatest success has been achieved. These have a special interest for the horticulturists of the present day on account of the difficulties hitherto experienced in raising them and which have now in a great measure been overcome, and the length of time which elapses before a seedling attains the flowering stage. Previous to 1872 Lælia exoniensis, Cattleya Dominiana and Cattleya Brabantiæ were the only hybrid cattleyas and lælias raised. Cattleya Fausta flowered in '72 and was Mr. Seden's first hybrid, which was subsequently followed by crispa and delicata, since which time many remarkable forms have appeared in quick succession, including many bigeneric forms which twenty years ago would not be dreamt of. Lælia caloglossa took nineteen years to arrive at the flowering stage; now six and seven years is about the limit.

After enumerating and describing a number of the most notable cattleya hybrids, Mr. Robinson then proceeded as follows: Lælias are another genus of stately growth and in close affinity to cattleya. Indeed the difference is principally botanical. This genus embraces many fine forms, but from a florist's standpoint the Mexican species are the most useful. Twenty years ago a plant was sent to Europe. It flowered and was a white form of lælia which was named Dawsoni and not one has been sent home since, and all plants of Dawsoni in cultivation are descended from this one plant. But a few years ago in an importation to Europe many valuable forms appeared, including Amesiana, rosy sepals and petals and splashed lip of darkest maroon, and Schroderæ, with deeper sepals and petals. Mr. Robinson here mentioned a number of the most notable of the finest recently introduced forms, including the various beautiful white varieties, and said that, whereas ten years ago we could not produce ten white flowers of anceps, as many as ten times that number are today produced on a single plant. These plants, he continued, are of easy culture in cool greenhouse well exposed to the light, with plenty of water during the growing season.

Dendrobiums are a genus which have increased in large proportions, not alone in the species, which are manifold, but in the quantity and quality of artificial hybrids which have been produced. D. Dominianum was the first artificial hybrid raised, and has been followed in rapid succession by dozens of beautiful forms and which are easily cultivated. The species which has made greatest strides during the past ten years is nobile, the forms appearing being legion, but the old nobile nobilius "true" stands today unequalled. The re-introduced beautiful species Dendrobium Phalænopsis after many years and when only a few plants were known fills a great space in the orchid world, flowering in November and December, when dendrobe flowers are the most scarce, and also in the spring. They will grow well, but must have plenty of light and heat, and the flower spikes will be produced in abundance from the summit of the bulbs, the spikes consisting of twenty or more large flowers of various colors charming in effect when used cut separately or mixed with other orchids.

Odontoglossums crispum, Pescatorei, etc., were barely known in 1870 and today they are grown by the hundred thousand. Such strides has the culture of this genus made that where one plant was grown less than twenty years ago now whole houses are devoted to these, the most chaste and beautiful of the orchidaceous family, embracing, as it does, so many lovely and graceful forms. These have proven of such easy culture that I hope the day is not far distant when no gentleman who has a greenhouse will be without his collection of odontoglossums and masdevallias.

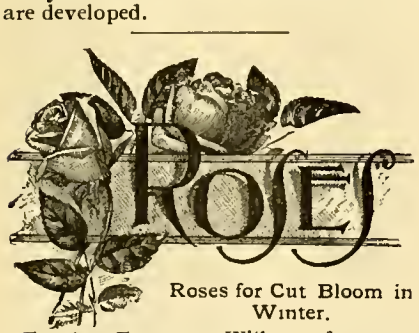
The masdevallias are a class which appeal more to the gardener than to the florist, but no collection of orchids should be without them. Grown under the same conditions as applied to odontoglossums they thrive well and have increased largely during the past few years. Twenty years ago I knew of about half a dozen species worth growing. Mrs. Ames' collection today comprises more than one hundred varieties exclusive of our own houses. A north house with a temperature of 55° by day, falling in severe weather to 45°, suits them exactly. Keep them well to the light with plenty of moisture, atmospheric as well as at the roots.

And Miltonias, the genus which now embraces the types originally known as Odontoglossum vexillarium and Roezlii. How well I remember in the spring of 1872 when I was with that indefatigable grower, John Seden, then as now in Messrs. Veitch's, when Chesterton brought one case of vexillariums, out of which about seventy-two plants were saved. That was the sensation of the time, the famed scarlet odontoglot. Wallis and Roezl had failed in previous attempts to deliver this plant alive, and these therefore were the first to survive the journey from their native habitat. Where and how to grow them was the question. They were tried cautiously in several positions and watched carefully through that summer with motherly care, and by February of 1873 the first Miltonia vexillaria flowered in cultivation and was sold for one hundred dollars, since which time, owing to collectors exercising more care, importations have occurred without much difficulty and the culture of these plants has increased rapidly. The flowering season now extends from February to August and numerous fine varieties are constantly appearing. But the marvel of the past three years is the hybrid Miltonia Bleui splendens, the result of a cross between M. vexillaria and M. Roezlii. It was raised by M. Bleui in Paris and Veitch, London, in 1889-90. The flowers are about four inches across vertically, lip about three inches across, the sepals and petals white, suffused rosy purple, the lip white with fan-tailed red and brown blotch in front of disc, which is yellow with deeper lines on crest. This plant flowers in April and lasts over one month in perfection.

Calanthes are another genus which has responded to intelligent cultivators very rapidly since the time Mr. Dominy produced that beautiful hybrid, C. Veitchii, which was the result of fertilizing C. vestita with Limatodes rosea, and which at that period was hailed as the coming decorative orchid. Since that time, however, many new and valuable species have been imported; these in turn have been submitted to the hybridist's art and the result is marvellous for calanthes. Great activity has of late been displayed in the raising of these hybrid calanthes, and success has been achieved in the production of the darkest and richest forms not even dreamt of ten years ago, and the good work is still going on.

Cœlogynes, though not yielding to the hybridist's skill as yet, have made wonderful advances. They will grow like weeds and will flower equally free. They are easily increased and will respond generously to proper treatment. To those who have not tried them in baskets or pans suspended near the glass I would recommend that they try it. Such plants when in flower amply repay any trouble and can be used as decorative plants either on stands or suspended from brackets. Maxima and Leonoreana are desirable kinds, as also the pure white form hololeuca, which is of exceeding easy culture. From twelve bulbs received seven years ago we have one plant today four feet in diameter and two more which are nearly two feet across. It is a variety I can thoroughly recommend, it being absolutely white and a charming mass when in flower.

No genus has attracted the attention of people so much as cypripediums. Large quantities of these plants have from time to time been imported, including among the most notable the stately Rothschildiana, the distinct and highly colored Chamberlnini, the spotted bellatulum, the Shuttleworthi, which eclipses the Spicerianum and others equally beautiful. When I was with Mr. Seden in 1872 there were three hybrid cypripediums and one selenipedium which had flowered up to that time, since which time so many people have become interested in them that new seedlings are appearing so rapidly that it is now impossible to keep a record. The most unique and valuable species to-day are without doubt Stonei platytænum and Fairieanum and the most valuable varieties are C. Lawrenceanum Hyeanum and C. insigne Sanderæ, the golden form of insigne and to me the most charming of them all. It would be impossible to enumerate all the beautiful hybrids which have been produced, but I must not omit the grand hybrid Morganæ, which approaches nearest to the rare and unique platytænum and stands to-day number one. Everyone should



Scale

CARNATION DAYBREAK AS SHOWN AT THE INDIANAPOLIS MEETING.

grow cypripediums. There is no time from January 1 to December 31 when you are without flowers and when cut they will last a long time in good condition.

There are still many more examples which could be cited to prove the progress made in the development of orchids, in oncidiums, phalænopsis, phajus, cymbidiums, etc. But for the present enough has been shown to demonstrate that there is an increasing demand, also to prove that the people are becoming more and more interested and also more enthusiastic in their desire for instruction and to become more conversant with the many marvels which from time to time are developed.

Roses for Cut Bloom in Winter.

ED. AM. FLORIST: Will you favor one of your European subscribers with information on the following points regarding the forcing of roses for cut bloom in winter:

1. What is the maximum distance from the glass at which roses may be successfully forced in winter—locality well open?
2. What distance apart should tea roses be planted apart on the benches.
3. Which are the best *red* tea or hybrid-tea roses for forcing, combining vigor, good color, erect stems, freedom of bloom and continued bearing?
4. How does the planting out in beds answer as compared with benches?

BELGIUM. H.

[Mr. John N. May has kindly prepared the following answers.—ED.]

1. This will have to be regulated according to the variety grown; for very tall growing varieties such as Mermet, Bride, Bridesmaid and others of that class an average distance of from four to five feet from the glass, but for dwarfer growing varieties such as Niphetos and others of that class they are better if placed say two, or two and a half feet from the glass. The great thing to consider is to place them so that they get full exposure to all the sunlight possible.
2. The best distance we have found in our long experience in this is about an average of fifteen inches each way for nearly all the varieties that are forced for market in this country. Some of course can plant them a little closer where the plants do not grow so strong.
3. The variety that in this country today takes first rank in this way is Meteor. This is almost identical in color with Jacqueminot, it requires, though a rather higher temperature than the ordinary tea roses. The next in point of merit, and in fact in many respects the superior of the above, is Souvenir de Wootton. This has all the qualities that the other possesses and combines with them a nice fragrance and is certainly a freer bloomer, though not quite so deep in color.
4. For the winter months we cannot procure so many buds on a given space of beds as from the benches, however after a long and careful trial of both systems we have come to the conclusion that it does not pay to have permanent benches at the price at which roses are sold in this country to-day, though for spring and summer use the beds are certainly preferable to the benches. There is one system by which this can be obviated or rather overcome to a certain extent, viz: to build up walls on the sides sufficiently high to bring the plants within the required distance of the glass, a wall of concrete, plank or brick, filling in the same with very large stones at the bottom, gradually reducing until they come within five or six inches of the top, over this place crocking or anything you like to keep the soil from working down in under the stones, and on this place the soil and plant the roses. If provision is made in constructing the side walls to carry air chambers through it it is also advisable, as it admits of more air at the base, thereby helping to dry up any surplus of moisture that might be carried down the strata of stones, and at the same time helps to conduct a little warmth to the roots. This, as your correspondent will see, is a modification of the ordinary planted out beds, and plants properly treated under such conditions will last for several years and if carefully handled will produce large and abundant crop of flowers. JOHN N. MAY.

Which Are the Most Profitable Varieties of Roses For Winter Forcing.

BY JOHN BURTON.

[*A paper prepared and read before the Philadelphia Florists' Club at its February meeting.*]

I shall no doubt fail to answer this to the satisfaction of you all, for I suppose you expect me to name varieties, and this I cannot do, as in my experience no one kind has been continuously more profitable than some others. If it is intended that the answer of this be asked as a guide for future planting, I would unhesitatingly say, the most profitable roses are those you can grow best, of course confining the varieties to those known to be salable.

One great mistake growers make, is to think that because their neighbor is growing some rose well and probably making something out of it, they must go into it as the only means of making money. It is well enough to try other varieties but if after a reasonable test they do not succeed, drop them at once. In the present state of the Philadelphia market there is plenty of opportunity for a man to grow specialties, or a few varieties in quantity, and this I believe to be the best plan, where the market is large enough to use big lots of one kind. Where a man has a special trade that requires him to furnish a great number of sorts it will sometimes pay him to grow kinds that he cannot handle so well and profitably as others. He may be located in a small town where it is necessary to have several kinds in stock; he may have a store and use all his own flowers there; or he may sell his entire product to one retail florist, who wishes him to supply a large variety. But when near a large town or market let him select the few varieties he can grow best and I believe he will secure the most profit in this way.

I personally know of several places where one variety has been grown better than others for several years and yet they have not confined themselves to these kinds but have attempted to try others because some one near was growing them well and presumably with a profit. In one case La France has been profitably

grown for three years in a small house, there being something about the soil or treatment, perhaps both, that it seemed to like, this being by far the best paying house on the place each year, the proprietor wishing during the flowering season that his whole place was in this rose. But why was it not all in this kind? Because he had been told that some one was getting fifty cents for Beauties, while he was only getting ten for La France, or he had visited some place where an extra good house of Brides and Mermets was just in crop with apparently more profit in sight than his La France house would bring him. Seeing these results he comes home determined to try his hand again with these varieties, hoping next year to get the big crop of Brides and Mermets and the high price for American Beauties. I do not say that Brides and Mermets could not be grown on this place, but I do say that with the same soil and treatment they have not done as well or been as profitable as La France, although there had been more money spent and more care taken to made them a success.

I do not for a moment advocate depending only on one variety and not trying new or old sorts that have not yet been tested on the place, but I do contend that in a majority of cases the rose that does the best with the grower will be the best for him to grow. If it were possible to see into the future and tell which would be the fashionable rose, which the favorite color, or if some particular variety would be scarce and in great demand, it would be easier to tell the sorts to plant for profit, but as this information can only be guessed at I would say do not be guided too much by what you *think* will be fashionable or scarce.

Referring to the original question I will attempt to show how impossible it is to answer it directly by mentioning some of the large growers for the New York market. It has been reported, with what truth I do not know, but still I think it very probable, that Mr. John Taylor's most profitable roses for several seasons were Watteville and Cusin; Messrs. Pierson were most successful with Meteor, and with Mr. Nash American Beauty was most profitable. Here we have four different kinds all going to the same market yet each showing most profit for different establishments.

Not being able to give a decisive answer to the question selected by you for discussion I have taken the liberty of giving a little advice for which I trust you will pardon me.

Carnation Notes.

We are now coming into those bright spring days when all the ventilation is needed that it is possible to give the houses. If your houses are not arranged to ventilate at the top and the bottom or sides it will pay you well to take out every alternate glass at or near to the bottom and arrange it so that they can be quickly removed and put back. There is nothing will help keep your carnations in a healthy, vigorous and blooming condition at this season of the year so much as plenty of good fresh air, and when we get those mild spring-like days it is best applied at both the top and the bottom so as to produce a good free circulation. Don't be alarmed if there is a breeze blowing over the plants providing that breeze is moderately warm. An old work on the growth and habits of plants that is filled with good practical points says the mechanical action of a light breeze is beneficial to plant growth and suggests that in lieu of getting this in the greenhouse syringing be adopted.

Care must be taken at this season with the watering; plants will need considerable more water than during the winter months; at the same time care should be used that the soil is not over-wet on very bright sunny days or you will have a rank soft growth that will give you awfully weak stemmed flowers.

Syringing should be done early in the morning so that when the sun gets well up on the houses it will have something else to evaporate without calling on the plants to supply the necessary humidity to the air. I do not think it advisable to syringe twice a day unless you find indications of red spider. If you do it is best to do it about noon when the sun is the hottest and the spiders are most active; a real good syringing then will destroy more than either the early syringing or a later one. If you do not have the spider and find that the air in your houses is getting too hot in spite of your good ventilation, apply water to the paths and sides of the houses in preference to using it over the plants. These remarks are as applicable to the young stock as to the old blooming plants.

It is not unusual to find a superabundance of side buds forming at this season and if you wish to be on top of the pile when your flowers are marketed it will pay you well to pull them off. A three-dollar-a-week boy can do this as well as a more experienced hand can and besides he will come in handy for many odds and ends about the place and relieve your regular hands over the busy spring rush.

Do you know that if you are propagating from plants that are grown for bloom the very best cuttings you can have are those taken about this time when the wood has been well hardened up by plenty of sunshine; that is, providing you have had sufficient ventilation on the houses to keep them in good shape.

ALBERT M. HERR.

Carnation Notes.

In the AMERICAN FLORIST of Feb. 8, page 600, Mr. Albert M. Herr, in his notes on seedling carnations, says that in experimenting on this line it will be well to recognize the fact that self-fecundation is abhorrent to nature, and that much better seed can be produced and the seed produce better plants if they are artificially fertilized. Now is this a fact? We have reasons to doubt it because we have ample evidence that self-fecundation is not abhorrent in nature, for so much of our seed is produced by self-fertilization that nature answers this question. If we only look carefully into the different species of plants that are self-fertilizing, we will find they abound on every hand.

Take the Leguminosæ family, it is self-fertilizing, and it has existed for thousands of years, and not degenerated, for did not Esau sell his birthright for a mess of pottage of lentils and is not the lentil as good to-day as it was then. It is a self-fertilizing plant. The pulse family are all self-fertilizers, and embraces some of the most beautiful trees, shrubs and plants. The cereals are nearly all close fertilizers.

Examine a canna closely and you will find the foliage is all over the stigma before the flower has a chance to be crossed. I saw a bed of Mme. Crozy cannas from seed last year equal to the named parent, showing it would take very little care to introduce a race of cannas that would come true from seed, and it is doubtful if a lot of Mme. Crozy cannas of that sort is not now on the market.

It is crossing that gives diversity and uncertainty to our seedling. We are continually confounding plant life operations with those of animal life; really they bear little relation to each other. If we look carefully into nature, we will find cross-fertilization the exception and not the rule, and no abhorrence or degeneration is apparent. I might go on and name many species of plants that do not cross, nor really have they any opportunity to cross.

If Cæsar carnation was grown in a climate like California where it could stand the winter, grown apart from other sorts of carnations, by careful selection of the best no doubt a race of carnations could be produced that would come true from seed.

Selection is of greater importance than hybridizing or crossing. Hybridizing species produces new combinations. Then the work of selection and improving begins. Having an ideal in your mind then select to bring the flowers up to your ideal. The work is slow but sure. A. GILCHRIST.

Sleepy Carnations.

I experimented with two houses of carnations this winter. Noticing that most of the growers advocate a night temperature of 55° to 60° I grew one house at that temperature, and one at 45° to 50°. I also used liquid cow manure once a week in the warmer house. The carnations cut from the warmest house were the finest carnations I ever grew, averaging about 2¾ inches, many measured 3½ inches, but as the Philadelphian says, they were sleepy and one day in a house temperature of 75° to 80° was all they would stand and complaints were universal, while the flowers from the cool house, though not quite so large, would last in the same house three to four days.

The question that arises is can we force carnations or had we better grow them cool and have a lasting flower.

GLENS FALLS, N. Y. A. J. B.

Keeping Qualities of Carnations.

Referring to the keeping qualities of carnations Mr. Doraer said in conversation with the writer at Indianapolis that he found the flowers that kept the best after being cut were those of varieties that produced but little pollen or in which there was some defect of the reproductive organs that prevented self-fertilization. As soon as fertilization takes place the flower begins to go to sleep and to make flowers last well this must be prevented or delayed.

New York.

A very pleasant feature at the March meeting of the Florists' Club was the installation of President O'Mara and Vice-President Asmus, both of these gentlemen having been prevented by sickness from attendance at the previous meetings of the year. The retiring president, Mr. Manda, in introducing his successor, thanked the members and especially those who had served on committees for their support through the past year and was

Scale
6 inches.

CARNATION MRS. ELIZ. REYNOLDS AS SHOWN AT THE INDIANAPOLIS MEETING.

glad to state that the organization was strong financially and numerically nearly double what it was one year ago, predicting that the coming year would be the most prosperous in their history. In responding Mr. O'Mara promised to do all in his power for the club's welfare, sacrificing his private interests where necessary for the good of the organization and hoping for the same hearty support that had been accorded his predecessors. The other officers-elect followed with similar sentiments.

The committee on the legality and advisability of taking stock in or endorsing the scheme of a proposed palm garden made an adverse report, which was accepted. The question of a club headquarters, which had been assigned to this meeting, was after discussion referred to the executive committee. The committee entrusted with the settlement of the spring show question reported unfavorably and their report was adopted. The matter of a fall show was discussed and finally left to the next meeting for decision. The inadequacy of the greenhouse buildings in connection with the public parks was also brought up and New York's inferiority to other cities in this respect commented upon with the result that a committee of ten gentlemen was appointed to agitate the matter and confer with the park commissioners.

The introduction of the subject of duties on various imported plants and roots as contemplated in the Wilson bill started quite a flow of oratory, but the advocates for protection on these goods soon demonstrated that they were in a great majority, and those favoring the other view obligingly abandoned the set-to, and so the duty may go on without molestation as far as the New York florists are concerned. A proposition from the Farmers' Club looking to co-operation between that body and the Florists' Club in giving exhibitions and public lectures in a manner similar to that pursued by the Massachusetts Horticultural Society was referred to the executive committee. Four new members were admitted.

Among the new and interesting palms shown for the first time at the spring exhibition of the United States Nurseries were Pritchardia Thurstonii and Chamædorea Pringlei. Phytelephas macrocarpa, the Ivory Palm of South America, which is not yet in the trade here, is believed to have a bright future as a commercial decorative plant. It is a very rapid grower, specimens less than two years old being already three to four feet high and the foliage is exceedingly graceful. Cocos Botyracea is another valuable introduction from South America. In its small state it is similar to Phœnix reclinata. Another palm not yet in commerce, but which promises to be a useful plant for florists' use is Sabal glauca. There is a fine young stock of this coming on. Among Mr. Lager's South American collections are a philodendron with large foliage and yellowish variegation, and a very showy tillandsia with richly colored inflorescence and very dark blue flower. Also several new ferns, among which are two adiantums, one a free grower resembling scutum, the other an odd looking glaucus foliaged sort. Some seed of Pteris tremula and Smithiana sowed here recently seem to have got mixed, the result being a form intermediate between these two, having the dark stems of Smithiana, but not so stunted in habit nor so deeply crested as that variety.

Cut flower trade continues dull and the remarkable warm summery weather prevailing has brought in large quantities of flowers which have been disposed of necessarily in large lots at very low prices.

It will be perhaps cheering news for the growers and others that ten Dutchmen landed from steamer Spaardam and are now loose, starting the bulb season in America. These gentlemen should have due encouragement, not forgetting that there are more of them to follow, so that they may when they return home take with them hearts full of love for our beautiful country and its enterprising florists.

Have you noticed that in the Senate finance bill they propose placing a duty on orchids, lily of the valley, azaleas, palms and decorative plants, etc.?

J. G. Hallock, for many years confidential clerk for Theo. Pabst & Co., at 26 Barclay street, has been arrested, charged with misappropriating the sum of $65,839 of the firm's money and thereby causing its recent assignment.

Philadelphia.

The February meeting of the Florists' Club was well attended and the proceedings were of much interest to those present. Two new members were elected, and reports of committees showed that the work in connection with the next convention was progressing favorably. Mr. Burton's paper on "The most profitable roses for winter forcing," was the feature of the evening and caused considerable discussion. [It appears elsewhere in this issue.—ED.] In the discussion that followed W. Smith said "Mr. Burton is right, grow what pays the best and does the best for you." Mr. Heacock said, "Mr. Burton has put it in a nutshell." On being asked a question about Meteor Mr. Burton said it was as profitable as other tea roses and while it did not open very well in dark weather in midwinter it was no worse in this respect than most roses; it wanted more heat than most varieties. Mr. Becker said that he felt he was a small turnip in the patch, but he had been acting on Mr. Burton's advice and had been doing best by sticking to those varieties that he seemed to be most successful with.

Some discussion as to the effect of the new move of John Wanamaker in opening a cut flower department was indulged in and expressions both of approval and otherwise were called forth, it seeming to be the general impression, that it would work no injury to the growers and little if any to the dealers.

President Lonsdale gave a short account of his trip west and spoke in glowing terms of the show and the work of the convention. He had paid a visit to Mr. Dorner's carnationary and said that he was without doubt the foremost carnation grower in this country. He particularly mentioned the Stuart as Mr. Dorner had it and thought it a very fine variety. Goldfinch had a very stout stem but the flowers were rather undersized and there was not enough life in the color; it seemed very prolific. Mr. Dorner used a great deal of manure in his soil, about half which would be ruinous with us here, but the western soil seemed much lighter and could stand this enriching. Mr. Walter Coles' place was also visited and Kaiserins were seen which were a revelation to the visitor. They were growing in beds in the ground with pipes through the soil to give a slight bottom heat; the flowers were borne on very long stems and were larger than any Beauties he had ever seen; they were the perfection of form and truly magnificent in every respect. Mr. E. G. Hill's place was inspected but not much in flower was seen as his establishment was a plant and not a flower factory. Mr. Hill is a great manufacturer of plants, but can also set his machinery to turn out some winners in the cut flower line, as is evidenced by the trophies he has on exhibition.

The carnation show of the Chester County Carnation society was opened in the third story of Wanamaker's Grand Depot last Thursday morning. There

were about ten thousand flowers arranged in vases with from one dozen to a hundred blooms in a vase. The most numerous variety was Portia, of these there were quite a few vases of really fine blooms. Other standard sorts were L. McGowan, Hinze's White, Wilder, Anna Webb, Buttercup and Tidal Wave, which latter looked as good as any. There was also a lot of seedlings, pinks of promise some of them, and others anything but promising. Many of them looked as if a little Chester county air was needed to move their drooping spirits. Messrs. C. H. Allen and Dailledouze Bros. of New York, brought over and staged some flowers. Bouton d'Or by Dailledouze was very fine. Wm. Scott, Mme. Albertini and Daybreak from Mr. Allen were also excellent flowers. Fine vases of Helen Keller and Grace Battles, exhibited by Edwin Lonsdale, also added beauty to the show. Nathan Smith & Son of Adrian, Mich., sent a few Mapledales, a sort of Daybreak pink, and H. E. Chitty exhibited Spartan and several others.

The flowers were arranged on stage tables with three steps, such as are used to show off bric-a-brac, and the effect was good. The flowers were for the most part arranged the night before and many of them presented the proverbial sleepy appearance by the noon hour. If some of the professors with the long prefixes and affixes would analyze this tired feeling which seems hereditary to so many carnations and let up on the bugs and other bugbears for a time, something might be done. What value is a carnation that goes to sleep within twenty four hours after it is cut? Such a flower is a source of annoyance to every one who handles it, the grower, the dealer and the most important of all, the consumer, are alike disappointed and in most cases their expressions are anything but divine. We will guarantee that the entire expenses of a meeting of the Carnation Society that will give us a remedy for this defect, no matter where it is found, will be gladly borne by the florists of this city. All other questions are as nothing compared to this, for if the people lose confidence in the carnation, the society will soon pass out of existence.

The exhibits were renewed on Saturday and the show as a whole was a very creditable one. Mr. Dorner sent a vase of the new variety The Stuart, which arrived in fairly good condition. Bouton d'Or was the only kind that lived throughout the show; it presented quite a fresh appearance on Saturday afternoon. Eureka, a new bright pink exhibited by Thompson Bros. of Kennett Square looked well, as did vases of Sweet Brier and Ophelia. The Chester County society deserves a great deal of credit for this show which cost them considerable and for which they received nothing directly in return, if we may except the pleasure it gave the visitors. Even the press let them severely alone, as there was not a line in any of the papers except the paid advertisement in Wanamaker's regular columns.

Business has been very quiet the past week and prices have taken a tumble, in fact they have gone all to pieces. It was reported to be hard to get even the fakirs to take stock at almost nothing. Roses, such as good Brides and Mermets, going for less than one dollar a hundred, is enough to make the average grower sick. The fakirs said they couldn't give them away.

The regular quoted prices are, Mermets, Brides, La France and Meteors, $4 to $6; Watteville, Cusins, Perles, Gontiers, Niphetos, $3 to $4; Beauties and Belles, $10 to $20; Laings, $25; Brunners, $30 to $40. All these prices become very pliable on the slightest inclination of the buyer to invest in any quantity. Carnations sell at from $1 to $1.50 and $2 for the fancies. Valley is $2 to $3, daffys $3 to $4; tulips while not at all plentiful seem very hard to sell at from $3 to $5; sweet peas are in and sell for $2 per hundred.

There promises to be an immense stock of Easter plants, and while most florists are not praying for fine weather now as in most cases the stock is too far advanced, they are all hoping that old Prob. will do something grand the week following.

A visit to the growers finds many places with the sheds full of lilies, azaleas, and other stock being kept back as much as possible, while the houses are covered with mats or slats or a thick cover of white wash and the air all on. The exceptionally warm weather has upset calculations and makes it especially hard for the grower of Easter plants. Robert Craig, who has five thousand plants of lilies in good shape, says he will not grow so many again. The price has got so low that it does not pay for the trouble they take to get them all in on time. They have to be sorted so often and moved from one house to another, some to be kept cool and others hot, perhaps to the detriment of other stock, that at the present price they do not pay, and this seems to be the experience of all the large growers.

Easter stock is situated about as follows: Mr. Harris has a good lot of lilies, hydrangeas, spiræas, hyacinths, pot lilacs, and is especially strong on genista; his stock of this last is particularly fine in all sizes, and a fine lot of valley in pots. Mr. Craig has the largest stock of lilies and they are fine. He is easily first in quantity of azaleas (about 5,000 plants) and his Astilbe compacta is excellent, best we have seen. Daffs in pots and tulips in pans, as well as hyacinths, he has in immense quantities. Jacob Becker has fine hydrangeas, lilies, azaleas, and his roses in pots, such as Plantier, Magna and Brunner are extra fine. He has the rose market almost to himself. G. Anderson has a big lot of hydrangeas, for which he is famous, and a lot of lilies. Griffin Bros. of Frankford, have fine lilies, hydrangeas, hyacinths and some pot roses. Chas. Evans has a big lot of lilies, hydrangeas and spiræa. J. W. Colflesh has carnations in pots, azaleas, lilies and daffs. H. A. Dreer has a great many azaleas, mostly in small sizes.

It is estimated that there will be about 60,000 plants of longiflorum and Harrisii ready for Easter. Lilies are now offering at from 8 to 10 cents per flower, no charge for plant; 10 is the price held by most growers for good stock. Spiræa $25 to $34 per hundred, 6 to 8-inch pots; hydrangeas 50 cents to $1.50, in 6 to 8 and 9-inch pots; azaleas 40 cents to $1 and $2 for the most popular sizes in 5 to 8-inch pots; genistas 50 cents to $2.50 for the popular sizes, 6-inch bringing 75 cents to $1, extra large $3 to $5; hyacinths $8 to $10 in 4-inch pots; tulips 50 cents for pots of 12; valley 50 cents for pots containing about 20 pips. K.

Boston.

The monthly meeting of the Gardeners' and Florists' Club on the evening of March 6 was unusually well attended, the great attraction being the announcement that Mr. Wm. Robinson would read a paper on Progress in orchid culture. Mr. Robinson's paper is presented on another page in this issue. After he had finished reading he said that he noticed several orchid fanciers present and that if they had any questions they would like to ask he was ready to be tackled.

In reply to an inquiry by Wm. Martin regarding the length of life of a cattleya under cultivation he answered "from time until eternity."

Mr. Wm. Ingraham, representing Hugh Low & Sons of England being present was called upon, but responded with considerable reluctance, he being a very modest man. He said he would like to see the orchid question taken up more generally by florists than it is.

Jackson Dawson claimed to know nothing about orchid cultivation. He had, he said, a few hanging on the wall at the end of his greenhouse and his experience was that he could knock more fun out of a dozen orchids than out of any other class of plants that could be mentioned. His method of cultivation was very simple—when he passed with the hose if the plants looked dry he gave them a slap with it, if not he let them alone; there was no time of the year but what he had a couple of plants in bloom. He had once tried to kill a Dendrobium nobile by dipping it in a manure barrel every other day, but he did not succeed, and it is a big fellow now.

In reply to a question as to the advisability of leaving the tissue on the pseudobulbs of cattleyas or pulling them off to prevent scale harboring underneath it, Mr. Robinson said that the tissue is a protection to the tender bulbs and was intended to stay there until the bulbs were thoroughly ripe, but as of two evils it is always best to select the lesser, he would advise the removal of the tissue if scale should appear, as the scale is the greater evil.

The discussion was participated in by David Allan, M. H. Norton, James Wheeler and others, the general sentiment seeming to be favorable to a more extensive cultivation of orchids for commercial purposes.

Saturday evening, March 10, was a gala occasion for about twenty-five of the boys, who by a preconcerted arrangement gathered in the banquet hall of the Thorndyke Hotel. As all such reunions have a special end in view, so in this case the object sought was to make formal recognition of many past favors received and to pay present respects to their friend, that prince of jolly good fellows, Mr. Edward Hatch of plant auction fame.

The important duty of capturing this gentleman and enticing him to the feast was entrusted to Mr. M. H. Norton, a gentleman well qualified to act in this capacity. So when at the appointed hour the guest of the evening was ushered in and beheld the gathering of old friends, the tables laden with flowers and other evidences of coming hilarity it was with genuine surprise depicted on his countenance, and it was not until he had been been placed in the seat of honor and his eye rested on the special decorations of the bill of fare placed before his admiring eyes that he began to take in the situation and remarked "Ah! I begin to see."

All the boys were there. President Welch of the G. & F. Club presided and at his left sat the indispensable toastmaster in the person of Hon. C. W. Hoitt, who came armed with apt quotations from famous authors both ancient and modern wherewith to introduce the various speakers and at the same time call attention to their individual characteristics. So from the introductory, "I'm from New Hampshire, gentlemen," but

"What are these,
So withered and so wild in their attire;
That look not like the inhabitants o' earth,
And yet are on't?"

to the closing "Our revels now are ended" there was a continuous intellectual as well as material feast.

After the coffee had been served Mr. Welch arose, tapped upon his plate with a knife, buttoned up his coat and having struck a proper attitude started the ceremonies by introducing the toastmaster, who as soon as he had got his hands in his pockets and began to talk, was interrupted by Mr. Norton, who, turning to Mr. Hatch and addressing him in a few congratulatory words, presented him, on behalf of his gardener and florist friends, with a beautiful diamond ring. The recipient was caught for once where words were hard to find, a rare occurrence in an auctioneer's life, but he managed to express briefly and feelingly his deep appreciation of the occasion, whereupon he was pronounced in vociferous chorus to be "all right."

Judge Hoitt followed with a poem of much merit as a literary production, aside from the aptness of its references to the virtues and the failings of the individuals present, the central idea being

"Then here's to Hatch, our genial guest!
Drink quick, for no one knows
When the auctioneer'l replace the guest,
And then the whole lot goes."

Interspersed between the speeches the proceedings were enlivened by Warren Ewell's harmonica solos, W. J. Haynes' piano selections, Elijah Wood's songs and last, but not least, Mr. Ireland's delicious punch, generously contributed by that gentleman. Like all good sensible Boston gatherings the party broke up in time for the eleven p. m. trains.

The lecture at Horticultural Hall on March 10 was by Mr. Sylvester Baxter, ex-secretary of the Metropolitan Park commission, who gave an interesting account of the work of that commission and a description of the grand additions recently made to Boston's great public pleasure grounds in the form of over seven thousand acres of forest reservations, including the Middlesex Fells to the north of the city and the Blue Hills to the southward, also the plans for further acquisitions to the park system in the immediate future. On the exhibition tables were a collection of unusually fine hybrid roses from James Comley, Cherokee roses, Cypripedium parviflorum, etc., from C. J. Dawson of the Bussey Institution, and a plant of Dendrobium nobile nobilius from C. F. Lunt. A. H. Fewkes also showed a vase of Antirrhinum majus which exceeded in beauty any outdoor grown specimen, and called attention to the merits of this flower as a forcing variety.

George Wilson's greenhouses at Malden are worthy of a visit just now, as there are 50,000 or more Ulrich Brunners in splendid condition and various stages of forwardness, the prospects for a big Easter cut of this favorite variety being excellent.

Miss Flora Welldon, daughter of N. S. Wax, the florist, who has just returned from Europe, has given her Boston friends an opportunity to hear her sing. She has a superb voice, highly cultivated, and is assured of a brilliant future. Mr. Wax may be pardoned for feeling very proud.

Strangers in town: August Rolker, New York; Wm. Swan, Charlestown, N. H.; Wm. Ingraham, London; and H. J. Goermans, Hillegom, Holland.

Chicago.

The market last week was quite active. Although no great scarcity of any one article can be reported yet almost everything in salable condition is cleaned out by night. The demand for good stock in roses is particularly brisk, and carnations also are in good demand. Violets sell well, and are disposed of in large quantities but often at very low figures. Bulbous stock remains inactive, but shows some sign of improvement. Valley is in fair demand and some extra good stock sent in by Mr. Jurgens is noted. Tulips are very slow, but daffs are in better demand. Dutch hyacinths also are more freely called for. Of these we find some very fine stock at present. Smilax is looking up. The season for spring openings of our leading mercantile establishments is at hand, and smilax, which has been relegated to obscurity for months past, will form an important part of decorations for such purposes. There is also an improved demand for galax leaves, but these latter are getting scarce and are of very poor quality, as the season for them is over.

Prices are nearly the same as reported last week. Beauties, long stemmed, in very limited quantity, $3 per doz. for the best, $2 for seconds, short from 50 cents to $1. Hybrids are in fair supply and good demand. Brunners and Laings $3 to 4, second quality $2. Jacques come in quite freely, the best bringing $2, seconds $1 to $1.50. La France, Mermets and Brides, $3 to $4. Perles, Gontiers and Woottons, $2 to $3. Since Jacques have become more plentiful Meteor is in less demand and has dropped to $4. Some magnificent Gontiers are sent in by Geo. Klehm. These find a ready sale at $4.

Carnations, stock average quality, common sorts $1, fancy $1.50 to $2. Violets, the best quality sells at $1 per 100, but large quantities go at $3 to $5 per 1,000. Harrisii $4 to $6, valley $2 to $4, tulips $3 to $4, Dutch hyacinths $4, Romans $2 to $3. Mignonette is offered freely and meets with good demand. At Kennicott Bros. we noted some extra fine Machet.

A very active shipping trade is reported. Apparently the volume of trade in this direction is quite as large as last season, and would seem to warrant the assumption that the country trade is in a more active state, than is the case in our larger cities. Whether this theory be right or not, we are unable to say, but we are inclined to the belief that the fact of the great advantages of this city as a distributing center, is appreciated to a larger extent by both the retailer and grower. It is not an uncommon thing for a commission man to receive a shipment of stock from a grower in a country town, and on the same day ship it back again to a dealer in the very same locality.

The following personal letter was probably not intended for publication but is too good to be wasted. And publicity may help persuade Mr. Chadwick to take out his papers too! "When in Washington recently I concluded to run down to Mt. Vernon, and recharge my system with a double dose of patriotism. Of course I imagined that the current of the said patriotism was as strong in the gardens that George planted, as in the rooms where Martha sewed on his buttons, so I spent most of my time there. Mr. Franklin A. Whelan, the gentleman in charge of the gardens noticed my interest in its contents, and from my strong personal resemblance to Brother Craig, he mistook me for a florist, and ventured to ask me if I was such. Standing over the buried hatchet I could not prevaricate and blushingly answered no, but remarked that I have known one florist in Chicago for several years. This opened up his heart and subsequent developments informed him that I was the humble secretary of the Hort. Soc. of Chicago. Then the place was hardly large enough to hold me, and his courtesies culminated with his presenting to the Hort. Soc. of Chicago a gavel made of locust wood grown on the place. Now if we can get Pres. Chadwick to take out his naturalization papers, and swing this gavel at our meetings, good luck will follow us."

At a special meeting of the Horticultural Society of Chicago, held Tuesday, the 13th inst., the following self-explanatory resolutions were adopted:

WHEREAS, The Horticultural Society of Chicago taking a deep interest in the welfare of the Parks of our City, and believing that the excellent results attained in them in the past are due to the fact that political considerations have been excluded from their management, and that the present standard and further progress can be maintained only by the continuance of such policy, learns with dismay that one of the most thoroughly competent superintendents of one of our principal parks, viz., Mr. J. A. Pettigrew, superintendent of Lincoln Park, is about to be removed for political reasons; therefore be it

Resolved, That this Society express emphatic disapproval of such displacement for such reasons, believing that a most serious danger menaces our parks in the establishment of such a precedent, which will open the way to the removal of the present experienced and competent employes of the parks that their places may be filled by political incompetents, which cannot fail to result in an immediate lowering of the standard heretofore maintained.

Resolved, That the members of this Society have noted with pleasure the good work done by Superintendent Pettigrew in Lincoln Park—work that has shown broad knowledge of ornamental horticulture and rare administrative ability, and that the removal of such a man would prove a most serious loss to our parks, in any event.

Resolved, That the members of this Society, regardless of individual political affiliations, earnestly protest against such removal, and against the establishment of political qualifications as necessary to the holding of positions in the service of our parks.

The Florist Club at its last meeting also adopted resolutions as follows:

WHEREAS, It has come to the knowledge of the Chicago Florist Club that an attempt is being made to secure the removal of Mr. J. A. Pettigrew as Superintendent of Lincoln Park for political reasons, and

WHEREAS, This Club, composed of members of all shades of political faith, and including every important florist in Cook County, views with alarm any action that will tend to establish any other qualifications than ability and fitness for the place as essential to the tenure of such positions as that held by Mr. Pettigrew, and

WHEREAS, This Club, composed of professional horticulturists, and feeling itself competent to judge of such matters, is convinced that Mr. Pettigrew is the ablest superintendent Lincoln Park has ever had and that it is extremely doubtful whether another man of equal ability could be found to take his place, and surely none possessing both the ability and the broad experience as to the peculiar needs of Lincoln Park, which can only come by years of conscientious study of existing conditions under which results must be obtained, which experience has made possible the splendid progress toward making Lincoln Park what it ought to be during the last few years of Mr. Pettigrew's superintendency; therefore be it

Resolved, That this Club place itself on record as most vigorously opposed to the removal of Mr. Pettigrew from the position he has filled with so much credit to the profession, and that a copy of these resolutions be forwarded to the Hon. Board of Commissioners of Lincoln Park.

Buffalo.

Beautiful, bright balmy days abide with us, which is very conducive to getting a large lot of flowering plants in fine shape for Easter. Although I hear of several lots of lilies and azaleas that are a little too previous there promises to be a fine show here of all Easter stuff. Mr. Milley has a fine lot of lilies just about right. Mr. Sebastian Pickleman has a great crop of bulbous stuff, which looks to be the right age. Mr. Belsey has a fine lot of

lilies and azaleas which will hit the mark as near as possible. A very noticeable feature of Mr. B's establishment is a house of Mermets and Brides with a few Woottons, although in a house which is by no means the ideal rose house. The plants are and have been all winter looking remarkably fine for the space occupied. An immense crop has been taken from this house.

Mr. James Buxton of Niagara street was next visited; his specialty is violets, pot carnations and young palms. Mr. B. says his violets have scarcely yielded the crop of a year ago. His pot carnations are fine and are bound to sell well at any date. His favorite varieties for pots are old Garfield, Puritan and Grace Wilder.

A look in at the houses of Mrs. D. Newlands near Forest Lawn showed us a fine lot of lilies, azaleas, spiræas, etc. in good order for the coming holiday. As Mrs. N. does a very large cemetery trade in the spring a large proportion of her three houses is occupied with plants for that purpose.

Mr. Joseph H. Rebstock's fine houses are well filled with Easter stuff, noticeably azaleas and lilac; the latter have been most successfully forced the whole winter, Mr. Bishop, Mr. Rebstock's manager, tells me it is no trick at all. They are imported pot grown plants and force with ease.

On my way home I called in on the genial Christenson. His place is very gay with flowering stuff, a grand lot of cinerarias in most excellent shape. Lilies with 15 to 16 buds and flowers a few days earlier than is desirable. A mighty fine lot of azaleas but rather too early. However I am sure the veteran will manage to bring them before the public on Easter Eve in good order as he usually does. His violets are in fine shape and has helped pay for many little necessities—some call them luxuries—this winter. I was sorry to find Mr. Christenson suffering from a sore throat; he treated it as a trifle and said it was caused by his hollering to his Bermudas to stop growing higher.

I finished up the afternoon at the Cold Springs houses of Wm. Scott. He has a very large lot of most all kind of Easter stock and seems to have hit the date about right. I noticed a fine lot of Dendrobium nobile well flowered for Easter and which he feels sure will sell as plants. He grows a thousand or two of Lilium longiflorum, three bulbs in a pot, which he says are fine for cutting. Mr. S. says cytisus is selling this year better than ever, although he thinks it anything but a good house plant. Several hands were busy getting in flats of tulips, etc. to come in after Easter; Mr. S. anticipates a brisk and paying demand for this sort of stuff a little later on. He too I was sorry to find in trouble with a much inflamed left eye. I think it was the right that was left all sound. He assured me no one or anything had struck it, not even a man, but he had strained it looking for spikes of eucharis flowers among the beautiful foliage—spikes that never came.

Business at the stores is bound to feel the benefit of this grand weather, and so they have; flowers and plants have moved off nicely at fair prices. Violets are plentiful and so are carnations, but there won't be many spoiled between now and Easter. I intend to take a trip among the store men this week, and shall next week tell you all about their specialties.

Mr. D. B. Long is off again on another trip to secure some wonders for the great event. W. S.

Baltimore.

At the club meeting little was thought or talked of save the death of Mr. Robt. J. Halliday, who was always an enthusiastic member, and for the first three years of its existence was its president. Resolutions were ordered, and the banquet was indefinitely postponed.

As the annual election had to be held in compliance with the constitution the following officers were elected: President, F. G. Burger, 1120 Greenmount avenue; Vice-President, Wm. McRoberts, Jr., 304 Madison street.; Secretary, Wm. Feast, 228 N. Charles street; Financial Secretary, Wm. Ekas, Carroll P. O., Md; Treasurer, Wm. Sands, corner North and Baltimore street; Librarian, Chas. M. Wagner, Woodberry, Baltimore county, Md. MACK.

HOLLAND, MICH.—Charles S. Dutton has added a new house 20x80.

BETHEL, CONN.—George E. Beard has started a new florist business in this town.

HIGHLANDS, N. Y.—The business heretofore conducted by Mr. Adolph Folger will be run hereafter by Mr. James P. Hayden.

OSAGE, IOWA.—A very interesting and instructive paper on house plants and gardening was read at the Farmers' Institute by Mr. Walter S. Hall, the florist.

FALL RIVER, MASS.—Fire in one of the greenhouses of Andrew M. Lee did $600 worth of damage to stock and about $100 damage to building on February 9. The building was covered by insurance, but there was no insurance on stock. The fire is thought to have been incendiary.

KANSAS CITY, MO.—W. J. Barnes, at 38th and Euclid avenue, has just finished two new houses, one 12x50 and one 20x60, made necessary by his bid for planting and decorating Troost Park being accepted. Mr. Barnes' houses are all heated by steam and piped throughout for water, which is obtained from a well and cisterns.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

Foreign Notes.

The number of visitors at Kew Gardens in 1893 was 1,733,386, an increase of 379,229 over the number recorded for 1892. The highest week day attendance was on May 22nd, when the number was 100,737. On June 18th was the highest Sunday record, 29,891.

The bulletin of the Royal Horticultural Society of Tuscany for January, 1894, contains a colored illustration of a new hybrid canna which, if the picture truly represents it, is likely to throw all the now popular varieties into the background. This novelty is named Italia. The blooms are represented as full eight inches across, color brilliant yellow, the petals broadly splashed with scarlet.

A writer in the *Journal of Horticulture*, who claims to have fully tested the varieties in question, ventures the opinion that Sweet Pea Emily Henderson "is nothing more nor less than a carefully selected stock of Queen of England."

Pansies, 50,000.

The Jennings strain of large flowering and fancy pansies now ready. Fine large blooming plants, all colors, $2.00 per 100; $15.00 per 1000. Medium size plants, for May blooming $5.00 per 100 by Express; 60c. per 100 by mail.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer, 114 Chambers street, New York. Next annual meeting second Tuesday in June, at Toronto, Ont.

THE very mild and spring-like weather of the past ten days has changed the situation materially in the mail trade and most houses are now doing well, with business nearly up to last year; though all feel doubtful if the losses made in February will ever be made up.

St. Paul, Minn.

Trade is slowly improving and we trust will continue to. St. Paul florists have had a very dull winter indeed, and unless trade picks up from now on and the Easter sales are good, many of them will balance their books at the end of the season with a heavy *loss* account.

The bright spring like weather of the past two weeks has brought everything forward in good shape. Lilies that were way behind have caught up with the procession, so to speak, and will be in full bloom for Easter. Others that were quite forward are already falling to pieces and will not last long. On the whole, however, there is an abundance of flowering stock for the Easter trade, and with only *fair* prices florists ought to reap a rich harvest. L. L. May & Co. have an extra nice lot of lilies as well as a general line of plants and a good supply of cut flowers. Aug. Swanson has a fine lot of hybrid roses which will be in all their glory soon. E. F. Lemke has some nice azaleas and lilies and will have a fine lot of teas, which are just now coming into crop. Chris Hansen and Alderman Warren have a general line of desirables, while the others have a fair stock of plants and roses.

We presume that St. Paul will have the finest Easter floral displays it has ever seen. We understand that two of the leading florists are to combine their stocks for the occasion and display them in a large store centrally located. The location of the store is not known to the writer, and perhaps the whole thing is surmise.

The State Association met in this city on Thursday evening, the 8th. Sec'y Swanson opened the meeting and Pres. Malmquist of Minneapolis presided. This was the first meeting that has been held in two years and was well attended and much keen discussion indulged in, we trust to the benefit of all.

A. S. Swanson read a very able paper on the advantages of a florists' society, full of pertinent suggestions and emphasizing the time honored theory that "in unity there is strength." This paper brought out quite a discussion, indulged in by Messrs. Wessling, Nagel and Hartman of Minneapolis and Messrs. Hansen, May and Currie of St. Paul.

The question box brought forth the fact that Daybreak, Silver Spray, Portia and Garfield were the most profitable carnations for our florists. E. Nagel thought Grace Wilder a better one than Daybreak; at least that had been his experience. Daybreak and Silver Spray were, however, considered the favorites by the majority of those present.

Mermet, Bride and Perles were considered the best three roses grown by our florists, that is, the most profitable for St. Paul and Minneapolis trade. L. L. May eulogized the merits of the Bridesmaid, claiming it to be the best pink rose grown today.

The best cure or preventive for fungus on the cutting bench is lime and hot water applied to the benches before putting in the sand.

Another question—Is the Testout as profitable as La France? The opinion of those present was divided, some claiming that the La France produced more blooms, the others saying that the Testout more than offset this by the quality, all flowers being perfect.

The next question provoked no little discussion, viz., What can be done to stop department stores from selling plants and flowers? This is the old battle ground which has been thoroughly discussed before in these columns. As a remedy a florists' exchange was proposed, but the question of expenses incurred in establishing and maintaining such an establishment had evidently not been considered by the proposers, and the drawbacks and fallacies of such an undertaking were ably set forth by L. L. May.

After adjournment the club retired to the other room, where refreshments were served and a merry time in general participated in. A general good feeling seemed to pervade the minds of all, and we sincerely hope that the *St. Paul Florists' Club* may be a thing of the near future. As intimated in Mr. Swanson's paper, such an organization could only be beneficial and would tend to bring all florists here together in harmonious action. We hope to see such a society established at once and steps taken immediately for holding a "mum" show the coming fall. Until such an organization is effected the Twin Cities will be regarded as merely a *way station* in the florist business.

FELIX.

HIAWATHA, KANS.—The florist business conducted under the firm name of Margrave & Ward and later changed to S. G. B. Ward, will hereafter be conducted by J. W. Margrave & Co.

GRAND RAPIDS, MICH.—Mr. J. W. Rawlinson has surrendered his contract for the Henry Smith greenhouses, and Mrs. Sarah Smith has taken possession and will continue the business at 130 Monroe St.

MILWAUKEE, WIS.—After March 1 the store business of C. B. Whitnall & Co. will be incorporated as the Whitnall Floral Co. The greenhouses on Humboldt Ave. will be conducted by C. B. Whitnall alone and a specialty will be foliage for florists' use.

IF YOU have not already done so send your adv. by first mail for our special spring number to be issued next week.

AMERICAN FLORIST CO.

St. Louis.

At the last regular meeting of the Florists' Club the committee appointed to examine into and report upon the advisability of holding a show made their report, and advised the giving of the show, provided suitable terms could be secured from the managers of the hall. They also recommended that a committee of five members be elected by the club to take charge of all preliminary and final arrangements of the show, and to have full power to act. That a guarantee fund of $600 or more be raised from the members of the club, towards meeting any deficiencies that may arise in the show funds. Also that music be provided for the evenings at an expenditure of about $250, and that the price of admission remain the same as last year, that is, 50 cents in the evening and 25 cents during the day. The report was received and adopted, and a committee, consisting of Messrs. Michel, Tesson, Waldbart, Fillmore and Schray, were elected to assume the responsibilities of the show, and are now actively at work getting matters in shape so as to be able to rush things.

A communication from Messrs. F. Dorner & Son was read, acknowledging the receipt of the Shaw medal. A letter was also read from the parties having in charge the awarding of medals at the World's Fair, requesting the engraving wanted on the medal won by Missouri's plants. After some discussion the words "To the Florists of St. Louis," were decided upon. In all probability the medal will be turned over to the Missouri Botanical Gardens for preservation and exhibition, as soon as received by the Club.

At the last business meeting of the Bowling Club, it was decided to provide some lunch and refreshments at the bowling meetings and the members were assessed to pay for same. The teams for the coming series remain the same as for the last one. The elegant leather medal provided by the club for the lowest average was awarded to John Kunz, who is forced to wear it at all bowling meetings under penalty of a fine of 25 cents. A prize was also offered by the manager of the alleys, consisting of a "pitcher and goblet" to be competed for by the club members under the following conditions: The two highest men in each team after the series is over to roll five games; the three highest of these six to roll five more games and the winner takes the trophy.

The first part of the week was cold and windy, and was hard on market plants; the last two days were fine and evened up matters somewhat. The market is no better than last week, good trade however is expected during Easter week, after which, owing to its coming so early a dull spell is expected until regular planting commences. Cut flowers are more plentiful and promise to be so through Easter.

R. F. T.

AMATEUR FRUIT GROWING is the title of a volume recently sent out by Samuel B. Green, professor of horticulture in the University of Minnesota. It is written with special reference to the climate of the northwestern states, and is freely illustrated. (Farm, Stock and Home Publishing Co., Minneapolis).

MARYVILLE, Mo.—M. E. Mergen has purchased several lots in the business part of the city, paying $15,000 for same, upon which he intends to build three greenhouses of the latest style of construction, to be heated by a Hitchings hot water boiler.

The Jacqueminot Carnation . .

IS A PERFECT SUBSTITUTE FOR THE JACQUEMINOT ROSE.

Many buy it in preference because of its lasting qualities, and you can have it in bloom when the rose is out of season. Send for descriptive circular, enclose 10c. and we will mail you long stem sample blooms. The color is a bright crimson (no black in it). If the blooms look dull on arrival, they have been chilled or frozen. Notify us, we will ship again.

Last Call

• • • FOR ADVS. FOR OUR

SPECIAL.....
SPRING NUMBER,

To be issued NEXT WEEK.....

Mail at once or you will be too late.

AMERICAN FLORIST CO.

Toronto.

The weather this last week has been simply beautiful but strange to say trade has been a little duller than usual. There is positively no accounting for the vagaries of trade these times; when one does not expect anything it improves and when one expects it to improve there is nothing doing.

A few Easter lilies are beginning to show in the stores already. There is likely to be a big stock of them in during the week before Easter though; nearly all the growers seem to have got them "on time" this year. "Daffs." are plentiful and the price way down. Roses are getting more plentiful but prices will probably stiffen until after Easter.

The advance list for the chrysanthemum show has been published and sent out. A post card addressed to A. H. Ewing, Normal School Gardens, Toronto, Ont., from any one wishing for a copy will be attended to at once.

Anguste Urbach, late foreman to Mr. C. Frost, is now doing business on his own account in Jas. Kennedy's old stand, 217 Brunswick Ave.

Frank Burfitt is working up a nice little business at the place on Wellesley St., lately occupied by Messrs. Plumb & Son. The business had been let down considerably, but as the store is situated in a good part of the city a good smart man should be able to work it up again. Frank is a hustler and is thoroughly conversant with all branches of the business. The right man is in the right place.

The chameleon craze has just struck Toronto. It is the finest of "ads." for the florist who has the vermin in his window on Yonge St. E.

HELENA, MONT.—Times have been dull here for the last six months but the banks are now open again and the outlook is brighter. Both cut flowers and plants are going at low prices. Carnations are selling for 35 cents a dozen and roses for $1.50 to $2.00 a dozen. Our Christmas trade was good, three large funerals helping to use up the chrysanthemums. There were more calls for cut flowers but individual orders were smaller than last year. Everything was sold. But at present the supply is greater than demand.

OUR great special spring number will be issued next week. Send adv. at once if you have not already done so.

Ipomœa Pandurata.

(HARDY DAY-BLOOMING MOON FLOWER)

AZALEAS FOR EASTER.

WE HAVE HOUSES FULL, AS WILL BE SEEN BY THE ABOVE ILLUSTRATION, OF AZALEAS FOR EASTER FORCING.

The plants are in the best possible condition, finely set with buds, not too far advanced to ship safely at this time, which will insure a supply for Easter. We can make selections of plants taken from different temperatures to give a succession of bloom. We offer plants

9 to 10	inches in diameter at	$ 4.50	per dozen;	$35.00	per 100.
10 to 12	" "	6.00	"	45.00	"
12 to 15	" "	9.00	"	70.00	"
18 to 22	" "	30.00	"		

The varieties we handle are the best market kinds. The 12 to 15 inch size are of exceptional value. Send for copy of **Dreer's Wholesale Price List** for 1894, mailed free to Florists, Market Gardeners and Nurserymen who enclose business cards.

HENRY A. DREER, PHILADELPHIA.

New Chrysanthemum, MRS. J. GEO. ILS,

A CALIFORNIA SEEDLING.

Flowers sent from San Francisco to the Chicago Show awarded a MEDAL.

A grand white, of remarkable substance, size and depth of flower. See Illustration in AMERICAN FLORIST of November 16th. The very vigorous habit, and our large stock of this novelty, enables us to assure the trade of good plants, and to guarantee safe arrival. To be sent out the 1st of March, 1894, at the following prices to the trade:

75 cents each; $7.50 per 12 plants; $14 per 25 plants; $25 per 50 plants; $40 per 100.

Piping for Hot Water.

ED. AM. FLORIST: Will you kindly inform me how many runs of 4-inch pipe are necessary to heat a three-quarter span rose house 18x112 feet to 60° at night by hot water on the "uphill" system. I now have three runs under south bench, three under north bench, one under south center and one under north center bench, but one of our local hardware merchants insists that the house is not properly piped. A. M.
Conn.

In answer would say that eight lines of 4-inch external diameter pipe should be sufficient to maintain 55° to 60° temperature in zero weather in an eighteen foot wide three-quarter span house, providing the boiler is able to easily operate the amount of pipe in the house. The arrangement of the pipes as you have placed them is correct. Not knowing the amount of surface in your house we cannot answer your question positively. If you will measure the number of square feet exposed glass surface in the roof, sides, and gables and add one-tenth of the number of square feet of wall surface, if other than glass, and divide this amount by three it will give you the number of feet of pipe the house should contain. To find out the number of rows of pipe divide this amount by the length of the house in feet.

Piping for Steam.

ED. AM. FLORIST: I would like to inquire through your columns the proper way of piping a house 20x150 for steam with 1-inch pipe, so as to have an even temperature throughout the house and not to have the ends warmer.

JOHN R. VAN BOCHOVE.
Kalamazoo, Mich.

The amount of pipe required will depend upon the amount of glass exposure and other exposed surfaces in the house. To find the amount of pipe needed take the square feet of glass surface in the roof, sides, and gables and add to this one-tenth of the number of square feet of other exposed surfaces, if of wood, stone or brick. Allow one foot of 1-inch pipe to each 2½ ft. of such surface. After finding the number of feet of pipe, divide by the length of the house to find the number of rows of pipe needed. To insure the gable end being warmed uniformly with the other parts of the house carry the pipes across the gable end or to the doorway. The best way to place the pipe would be to raise from the main supply, dropping from this point all the way to the return, placing valves upon both flow and returns at this end, also an air cock upon the lowest part of the return pipe. This will allow any two lines of pipe to be operated independent of any others, while the regulation of same is from one end of the house, thus saving a good many steps in the course of a season and allowing close regulation of the heat. The pipes may all be placed under the staging, or part of them carried overhead, as desired. They should be distributed evenly throughout the house.

NASHVILLE, TENN.—G. W. Currey & Co. have added a large chrysanthemum house to their already large plant and from the looks of the young stock are preparing to take first money at the next chrysanthemum show. Mr. Currey is cutting some very fine roses; among others the Bridesmaid and Kaiserin were conspicuous. Mr. C. says Kaiserin is not as good a keeper with him as the Bride but there is a style about it he says, that can't be beaten. Joy & Son have just added two more fine houses to their range. The small one, 25x70, is for carnations, the other, 30x100, is for roses in solid beds. Mr. Joy is preparing to grow more carnations in future; says they have done much better this year than usual.

The Arrangement of Flowers.

Following we present the first of a series of comprehensive articles on the arrangement of flowers written under our general instructions by Mr. F. F. Benthey. We have purposely treated at considerable length upon the elementary details, in response to numerous requests from subscribers for such instruction. The experts, to whom these articles will be simply a description of their own methods and experience will therefore pass them by, but to a large number of our readers we know they will be very acceptable. We have endeavored to "begin at the beginning," covering the simplest details fully and plainly and to treat the subject from a thoroughly practical standpoint throughout. And while the articles here presented will propably be of interest mainly to those of limited experience, later on we shall touch upon matters in which all may find something of value.

PROPER CARE OF STOCK.

Taking good care of our stock is one of the most important matters to consider if we engage in the cutflower business. It is the foundation of success. Without intelligent care we will surely find it a losing venture. The extremely perishable nature of our stock is such that it requires constant attention. No rush of business should ever allow us to lose sight of this fact.

Let us suppose we are located in a small city, but our trade is large enough to warrant us in keeping up a supply of cut flowers. Part of our supply we grow ourselves. Let us say we have a set of five houses of average size, one house in roses of different sorts, one of carnations in variety and one of miscellaneous stuff of such kinds as our trade demands; the other two will probably be in pot plants, which latter don't concern us just now.

Roses should receive our attention first, and it is of the utmost importance to cut the flowers at the proper time. We find it therefore necessary to go through our house several times a day. It requires some experience and good judgment to cut roses at the proper time. No rule can be laid down which would apply to all varieties.

The tea varieties, such as Bon Silene, Safrano and Gontier must be closely watched and cut just before the flower petals begin to loosen. Be careful not to cut too soon; although this variety will open when placed in water if cut in quite hard bud, the flowers will not develop into as large blooms, and generally will fade more or less. If the buds on the other hand are allowed to remain on the plants too long they will be worthless. When cut properly these buds may be kept for a week or more if the weather be cool.

The larger varieties, such as Mermets and Brides, should never be cut when in the bud state, but should remain on the plants until the petals begin to unfold. La France and Meteor are best cut when about half open.

Of course judgment must be exercised as to the season and also whether the flowers are intended for shipping or home consumption must be considered, but as we are not in the growing of flowers for the market, we will only consider the question from the standpoint of a dealer who caters to his own retail trade. However as such we must take into account the season of year, for in warm weather the flowers will open much quicker and better and the buds should therefore be cut a little sooner than in cold weather.

American Beauty and all of the hybrids should never be cut when in tight bud. In dark and cloudy weather the flowers may remain in bud for a number of days, but as soon as the sun strikes them will burst open very quickly, so we must watch them closely.

As soon as your stock is cut place in cold water. Never allow your flowers to get wilted after cutting. Wet the foliage before putting them away; it does not hurt the flowers if you should wet them also, but never sprinkle the flowers afterwards if you intend to keep them any length of time, as the water is apt to spot them.

Carnations will keep in good condition on the plants for some time, and need not be picked every day in order to keep them. But some of the colored sorts, particularly most of the pink varieties, are apt to fade if allowed to remain on the plants too long and it is best to gather them and keep set in water in a cool place.

Allow your carnation flowers to fully open on the plants before you cut them. Unlike the rose a carnation will not develop when picked unmatured; on the contrary it will shrivel and fade very soon, it will close again at night, will not keep as well.

If tulips and the rest of the varieties mentioned are grown in flats, these might be placed in a cool and dark place when in bloom, and cut when desired. The flowers will keep in this way for weeks.

Violets should never be picked until an hour or two before they are wanted. Put them in water before sending them out, as the flowers will last longer and give better satisfaction when received. The violet will lose its fragrance very soon after it is picked unless it be kept in a warm atmosphere and there it will soon wilt, so it is better to let your flowers fade on the plants if the demand should be below your supply, rather than to try to save them by keeping them in cold storage.

Lilies: Such varieties as Harrisii and candidum should be moved into a cool place as soon as the first flowers are open. If we can utilize short stemmed flowers in r design work it will be better to allow the buds to open on the plants; if not,

the first flowers will be gone before the last bud developes. If we desire to keep the flowers for some time it is best to cut the stock as soon as the first two flowers are open; the buds will readily open when placed in water, although the top buds on strong plants of say from 7 to 12 blooms to the plant, will seldom develop into salable blooms when thus cut. Lilies can be kept in salable condition without much trouble for two weeks or more. Callas also will keep much longer when cut before fully expanded, than when left on the plants.

Most people are laboring under the mistaken idea that cut flowers will last much longer when fresh cut and placed in a room. That such is not the case is a fact well known to the experienced florist. If flowers are gathered early in the morning or on a cool and cloudy day, and immediately carried home and placed in water and set in a cool room they will keep well enough, but when picked in the middle of the day and carried around for an hour or two, and then put in a warm room, it will be found that flowers picked the day before will last twice as long. Always pick your flowers early in the morning if possible, you will find they will keep better than those gathered at midday. Roses, as before mentioned, will have to be cut at different times, but avoid cutting when the sun is hot.

So far we have referred to flowers grown on the place, but if we wish to carry on our business successfully we will be obliged to buy more or less of our supply; these we draw probably from the nearest market. If carefully packed the flowers thus received, if the distance be not too great, and the stock is fresh when sent, will arrive in good condition, but it should receive your immediate attention; unpack the box at once, remove all bad and crushed petals when you take the flowers out, cut a little off the stems, if roses wet the foliage but not the flowers, place them in cold water and put them away in a cool dark place. If you wish to use the flowers at once of course you will have to take them in the shape they arrive, but if thus treated and only left for an hour or two before sent out, the stems will fill with water and stiffen the flowers and foliage and thus add materially to the keeping qualities of the flowers.

With carnations we must be careful not to wet the flowers, as these will shrivel up if put away in that shape, but cut the stems. The same will hold good with all bulbous stock. Keep stems in water but the tops dry. Chrysanthemums, when received in wilted condition, might be dipped, flowers and all, in water, but care should be taken to shake out the water from the blooms before they are set away.

Violets, if shipped from a distance of say 500 miles or more, will generally arrive though in sound condition yet without their fragrance. These flowers will often regain their sweet odor by putting the stems in warm water and keeping them in a warm room; to guard against wilting wrap the flowers in tissue paper.

If flowers are received in a frozen condition, dip in cold water and put them away at once in a cool place; avoid handling them as much as possible until the frost has been drawn out. A good deal of the stock can be saved even if frozen quite solid. When received in such a state better not unpack them but spray with cold water, cover with wet paper and keep them cool.

Flowers that have been frozen will not keep and must be worked up at once. Such varieties as roses, carnations, tulips and lilies will stand some frost without much apparent injury, while camellias, heliotrope and others will turn black almost immediately. Hyacinths, narcissus and valley will show a watery appearance in the flowers after the frost is drawn out. All such stock is only fit to work up in designs which are not required to keep above a few hours, such as funeral work. If no orders are at hand to work the stuff off at once better throw it away, as it is sure to work injury to your trade if sold for fresh cut flowers.

Now let us consider the best place to keep flowers. There is no question in our mind that a dark cool cellar is far preferable to an ice box. If your salesroom is connected with your greenhouses your first care should be to provide such a place for keeping your stock. Have it roomy enough for your needs and be sure to provide proper means for ventilation. Have the floor cemented and always keep it sweet and clean. Such a cellar will cost but little and will soon pay for itself. In the first place you will save the cost of ice the greater part of the season; besides flowers kept in such a place will keep in good condition better and last longer when taken out than those preserved in an ordinary ice box.

If we do our business in a store we are often obliged to resort to the refrigerator but if we do let us be careful to select one best suited for our purposes. There is a vast difference in the keeping qualities of refrigerators as regards flowers. The great majority of these boxes are totally unfit for our purpose. An ordinary refrigerator is built with the purpose in view of keeping the air as dry as possible. This is the box that is required for keeping meats, butter and eggs, but is not the kind we want. We need one that retains a certain amount of moisture. We can test such a box by placing a number of jars in it filled with water, which should evaporate the required moisture, then wet a piece of tissue paper and put in the box in the evening. If you find your paper dry in the morning your box is too dry for your purpose. Besides we must pay attention to temperature. We do not want it too cold, from 35° to 40° is better than 33° to 35°. If we select our refrigerator on those points we are pretty sure to get what we need. If you wish to give some attention to appearance have it as handsome a piece of furniture as you wish, but fight shy of a glass front. Your stock needs to be kept dark as well as cool.

Vases or jars for keeping flowers should be selected of such kinds and shapes best suited for our purpose. "Anything that holds water" doesn't answer. Let us consider this subject from the point of utility, that is shape, size and depth. So long as the inside is glazed it matters little if the material be the commonest clay. When we speak of shape we only lay stress upon the point that the vase should be somewhat flaring at the top. Flowers placed in such a vase will not crush together as in one straight up and down. The size will readily be determined by your requirements, but proper depth should never be overlooked. Such flowers as Harrisiis, callas, chrysanthemums and long stemmed Beauties and hybrids should never be placed in shallow vases. The three varieties first mentioned particularly will absorb a great amount of water in 24 hours. The vase or jar to hold these should be from 12 to 18 inches deep, according to length of stem; and be careful not to crowd too many flowers in one vase, for even if your vase be of proper depth you will often find that every drop of water has been absorbed in less time than you would think possible, and the stems will stand dry.

Now that we have put away our stock in proper shape don't for a minute suppose that it won't require further attention until sold. Establish a rule, and never deviate from it, to carefully look over your stock every morning, pick off all the bad petals from the flowers, snip off a little off the stems, empty and refill your vases with fresh water, and put them away again.

Mignonette and asters for instance can be kept a long time, but these flowers render the water offensive in a very short time. The vases these flowers are kept in also get slimy very quickly, so take good care and clean them thoroughly at least twice a week.

MOSSING DESIGNS AND BASKETS.

The "mossing up" is the first step in making up a design, and it is not such an unimportant matter as the new beginner is often led to believe. It is in fact of so very great importance that to have it done right a good "maker up" will often moss his own design if it be of a particular nature, rather than to trust it in the hands of a boy who is generally trained in to do this kind of work in large establishments. The sphagnum moss generally used for this work comes in bales or crates and is usually received in a dry state and is unfit for use in this condition. Open the bale, shake up the moss thoroughly, as you will find it lumpy, but don't break it up too fine. Pick out all the coarse roots you often find in it, and then wet it sufficiently to have it moist, but be careful not to pour too much water on it. It is worse to have your moss too wet than too dry. If too wet the sphagnum will pack too solid, and besides it adds an undue weight to your design. Always keep a supply of your moss properly prepared on hand ready for use; you will find it a great saving of valuable time when you are in a hurry.

Flat wire designs, such as crosses, wreaths, etc., will have to be "tin foiled" before the moss is put in. Get a grade commonly called "florists' foil" which is of the right weight. Cut the foil in pieces of proper length to fold around the frame, allowing about ¼ of an inch to fold over the edges. Then put in your sphagnum and press in firmly, but not too hard; if the moss is rammed in too tight you will find it difficult to insert your picks. Above all lay in your moss evenly; an inexperienced hand will generally get it high in one place and low in another, some spots so loose that a pick will not hold, and another place as hard as a brick; bear in mind that it is difficult to turn out a first-class piece of work with a poorly mossed frame. The moss should be slightly raised above the edge of your frame; you can turn out a better looking piece than when mossed flat, but don't go to the other extreme and moss too high. For tying designs of this class we prefer white spool cotton, say No. 10; this should be passed around your design sufficiently to keep the moss in place.

For upright wire designs it is best to line your piece inside with green sheet moss instead of tin foil. A well finished piece of work of this kind, although the back is not designed to be viewed, should be backed up with green, and if green moss be used in place of foil the appearance will be much better. This sheet moss should be procured in the fall, when a stock may be laid in to last for the win-

ter. If kept dry in a cold cellar or storage room it keeps green a long time. Spread out in quantity to your need from time to time and wet thoroughly and you will find it as fresh and green as when first gathered.

Baskets of open wicker work and like nature will also have to be lined inside with foil, but for large flats, pillows, and designs of that nature, we may use some grade of heavy paper. This answers the purpose of keeping the moss from sifting through equally as well as foil and is much cheaper. If paper be used for a pillow you will find it necessary to use foil in the corners of your designs, since it is difficult and takes too much time to make your paper fit into them.

It is difficult to state how high your baskets should be mossed. It depends on the shape and on the effect we desire to produce, but in every case the moss should be raised above the rim of the basket, if the effect is to be showy moss your design high. Baskets of irregular shape will often have to be mossed to follow the lines, in order to give the desired effect.

For tying in moss in baskets we prefer to use wire, No. 26 or 28 will answer the purpose very well; draw the wire through the rim of the basket, not around it. If string be used something heavier than spool cotton is required; a light grade of cotton twine such as is used generally for tying up small packages will do. Draw your twine through the rim of your basket or design; this is easily and quickly done by using a packing needle. You should always avoid passing the twine around the outside of your basket as this will give a slovenly appearance.

For designs of a special character no rule can be laid down; the nature of your design may be such that one part may be mossed high and another part quite low; you must be guided in such a case by keeping in mind the effect you wish to produce.

There are very few men who moss exactly alike, but on all essential points most will agree. We cannot expect that a new beginner, even if he follow the hints above given to the letter, will be able to "moss up" a piece correctly the first time; the main point is to start in the right direction and a little practice will do the rest.

STEMMING AND WIRING FLOWERS.

The stemming and wiring of flowers is, next to "making up," the most important matter in design work. It is essential that a new beginner should start in the right direction, from the first time he takes hold of wire and pick. If you start in wrong you will find it a difficult matter to break yourself of an acquired habit though experience may prove it to be a bad one. Many old-timers will recollect the age of broomstraw and spool cotton. Cut flowers in those days were mostly cut without stems and for bouquets. The flowers were tied onto the broom straw, cut in proper length, by means of cotton thread. For design work also broom straw was used to a large extent; toothpicks at 35 cents a box, obtained at the corner drugstore were considered too expensive a luxury. Even with those primitive means a good stemmer would become quite expert, and we can well recollect when wire came in general use how awkward we found it to handle the new material, and for quite a time we clung to the old style from sheer habit.

Let us first take up the stemming of carnations on picks. The picks used should be of good quality, as a poor article is a nuisance to handle. Use only hardwood picks as all other grades are liable to break and you will have to do the work over again. For wire use No. 36. Cut it in five equal lengths to the coil for general use. For first practice you may probably find it better to have your wire a trifle longer, as you are apt to pass it around the pick and flowers oftener in order to fasten securely, than is really necessary. In that case cut the wire in four lengths to the coil.

Now take up a bunch of wire and hold in your right hand between your third and little fingers, and hold the pick in your left, in the position shown in our illustration Fig. 8. Fasten a piece of wire

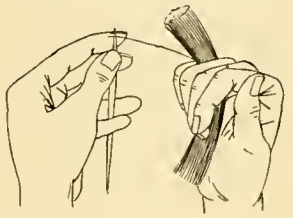

Fig. 8.

to the top of the pick by giving a twist overhand, draw the wire out of the bunch by a motion of the right hand, at the same time pick up the flower with your right and place it against the pick and give another overhand wrap around flower and pick, Fig. 9. Be careful you

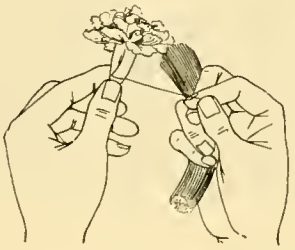

Fig. 9.

place the flower in such position that the first two turns of the wire will pass around the calyx of the flowers, draw the wire around firmly but not too tight, as the wire will otherwise cut through the calyx; now give a rapid twirl to the pick between your thumb and index finger, Fig. 10, until the end of the wire passes

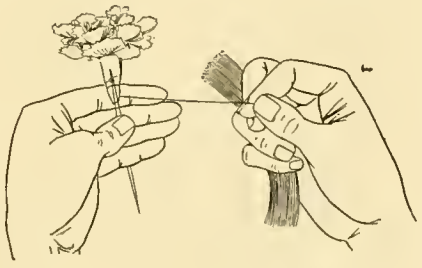

Fig. 10.

around the pick when it leaves the hand as shown in Fig. 11.

An experienced stemmer may safely omit the first movement, that of fastening the wire to the pick first, but if the novice should do so he will find his flowers slip off the pick nine times out of ten. On the whole we think it the best plan anyway as it will give the best satisfaction and the first is as quickly done as the other.

In a general way carnations are stemmed on whole picks, and if to be used for small flat design, the pick is shortened with a sharp knife to the desired length, although some florists prefer to cut their picks to the desired length before stemming. Care should be taken to wrap all the wire around the stem and not leave

Fig. 11.

an inch or so sticking out, as this interferes with your work. And don't run it too far down to the point if you have to shorten your pick by cutting.

There are other modes of stemming carnations which are often practiced when in a great rush, and by some habitually.

The first, as shown in Fig. 5, is done by using wire of say No. 24. The wire, cut in proper lengths, is simply run through the calyx of the flower and bent down; it is done more rapidly than wiring the flower to the pick and on this point has its advantages, but is not as satisfactory on the whole. The same might be said of the practice of simply sticking the pick into the lower part of the calyx by breaking the flowers off short, as shown in Fig. 7. Only flowers with perfect calyces can be stemmed this way; if the calyx be split, as we too often find it, it can't be done satisfactorily, besides the flower will easily slip off the pick if shoved closely into the moss, as it should be. Fig. 6 shows a flower stemmed in the way recommended.

Although we advocate the use of as little wire as possible for the artificial support of flowers we find nevertheless that we cannot altogether do without it. But if we have to resort to its use let us do it neatly and make it as little noticeable as possible. The lines showing the wire in our illustrations are heavier than the relation to the size of stem would warrant. This was done in order to show up the process plainly.

We should never use a supporting wire to a rose if the stem is strong enough to support the flower in an upright position, but if weak we must resort to the use of wire. Use a No. 26 or No. 24 wire, cut in any length desired, insert one end of the wire into the calyx of the flower and then twist around the stem as shown in Fig. 1 and Fig. 3. As we wish to preserve the natural appearance of the flower, care should be taken to pass the wire between the foliage on the stems and not twist it out of shape. Avoid the practice, often noticed, of stripping off every leaf from the stem and then wiring them in a bunch close up to the flower.

Fig. 3 shows a half long rose stemmed for a bouquet with the supporting wire. If such a flower is wanted for a large bouquet you may have to run a double wire somewhat lower than shown, and at the lower part of the stem you may also wire in any loose leaves you have on hand.

Fig. 2 shows a rose strong enough in stem, but too short for the purpose intended, and the wire, which should be No. 24, serves the purpose of lengthening the stem.

Fig. 1 shows a half long rose wired for a basket. For this kind of work we prefer the matchstick to the ordinary pick, in fact in large pieces where long stemmed flowers are used it is indispensable as the pick is neither strong enough nor long enough to support the flower. These matchsticks come generally in lengths of two feet, and can be cut in any length desired. Get your stock from some responsible dealer in supplies, as there is any quantity of poor and brittle stuff in the market that is worse than useless. There is nothing so trying to one's patience, not to mention loss of time when you are in a hurry, as to find that every other flower you pick up is stemmed on a brittle stick that will snap in two when you try to insert it into the moss.

In Fig. 4 will be seen a weak stemmed rose wired for what is generally termed festooning, that is the flower to be raised more or less above the level of the body of your design. The wiring of roses through the flower is not practiced as much now as formerly; the flower-buying public strongly objects to it and with very good reason. We do not hesitate to condemn this practice as a fraud if the flowers be sold loose and as fresh stock, but for some purposes it is allowable and has even its good points. For instance let us suppose you have a lot of gentlemen's boutonnieres to make and at the same time have on hand a supply of Bons or Gontiers, which threaten to open shortly and probably go to waste. These roses, neatly wired, will answer your purpose very well, and furthermore the wire will keep your rose in the bud shape and besides it will not break off and be lost to the wearer, as is often the case when the bud is not wired. Use a No. 36 wire for this purpose. Close the fingers of your left hand around the top of the bud to keep the petals in position and run two wires through the flower from two sides, as shown in Fig. 12, bend the four ends of the wire down and twist around the stem; see Fig. 13.

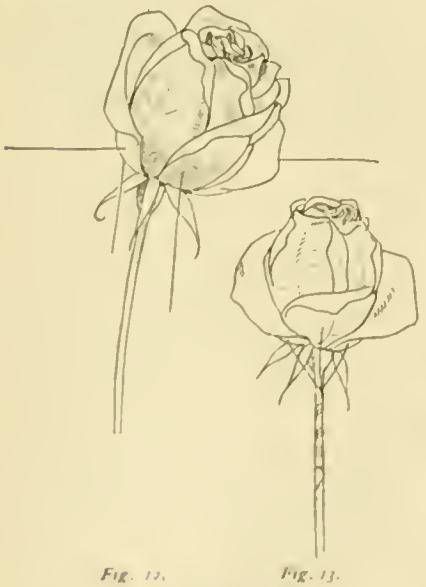

Fig. 12. Fig. 13.

WIRING ROSES

Roses that are wired in this way should not be kept long. When wet the wire will soon rust and discolor the flower. Sometimes copper wire is used, which doesn't rust, but this wire is so soft and pliable, that a much heavier wire will have to be used and is therefore very objectionable.

Camellias are not used very much nowa-days, and those we get now are often cut with stems and therefore don't require wiring. For the wiring of shortstemmed flowers use No. 26 wire. Handle the same as roses and twist the four ends of the wire together closely. When used in a flat funeral design as most of these flowers are, insert the wires right into the moss, or else tie to a pick first.

Pansies when worked into a design will not always hold up their heads, in a desirable way, and we find it necessary to often wire a few flowers. Take a No. 36 wire and insert one end into the calyx and twist around the stem, then tie three or four flowers with a leaf or small branch to a pick, or if wanted for a bouquet to a No. 26 or No. 24 wire.

Besides the above mentioned there are many other varieties that require the use of wire, particularly when the stem is short and the flower is wanted for a bunch or design that requires additional length, but in all such cases we trust that the hints given above will be sufficient.

VARIOUS MODES OF STEMMING ROSES AND CARNATIONS.

ARRANGEMENT OF SIMPLE AND INEXPENSIVE FUNERAL DESIGNS.

Foliage and greens in their various forms are indispensable in design work. So great indeed is their importance that we should give this subject a most careful study. It is not our intention at present to enlarge upon this matter further than is necessary to illustrate the subject matter in hand but as we progress with the forms of arrangements we shall enter more fully into this subject as it may suggest itself in connection with the individual characteristics of either flower or design.

Our present aim is to describe and illustrate designs in their simplest forms suitable for funeral purposes. Let us start with a cross. Having followed our instruction and mossed the frame in proper shape we shall proceed to "make it up." The first step will be to arrange the green to form the background. This back ground, aside from adding to the effect of our design, also serves largely to enable us to economize in the use of flowers. Smilax and hardy ferns are the cheapest and best material for our purpose. Select a string of smilax, not too heavy if your piece be small, and fasten it around the edges of the cross by means of a No. 24 or 26 wire cut in suitable length and bent to form a staple. A supply of these should be ready at hand for instant use. Having arranged the smilax around the edge cover the sphagnum with hardy ferns as shown in illustration No. 1. If callas be used in the piece you will find it best to imbed the stem in the moss as the flowers will flag very quickly otherwise. In this case the calla had better be placed before the fern leaves are put on, as otherwise you are apt to disarrange them.

Our first illustration shows an 18-inch cross with calla placed in proper position and covered with green, which completes the design in its first stage.

ARRANGEMENT OF CROSS. ILLUSTRATION NO. 1.

If a number of designs are to be make up, we will find it to our advantage to pass them all through the first stage before we advance to the next step. Let us constantly bear in mind that the saving in time, if only a few minutes, is often of the very greatest importance, especially in work of this kind when the order is of necessity given on short notice, and every minute counts.

We will now advance to the second stage, the base work, or what is generally termed the "blocking off" of a piece. For work of this kind we may use short stemmed carnations, short stemmed or broken off roses, in fact all sorts of odds and ends in white flowers that may be at hand. Generally carnations form the bulk of the material for this purpose, though white roses, such as Brides that have opened a little too far to be salable as cut flowers can also be used to advantage.

In illustration No. 2 we show the cross "blocked" and ready for the third and last stage, that of finishing, or "festooning" as we generally term it. As will be seen in No. 2 the flowers in base work are set in loosely and quite a distance apart. Our object should be not alone to turn out a tasteful piece of work, but to accomplish it by the use of the least possible amount of material. Few designs such as crosses, wreaths, etc., are blocked off now-a-days as was the practice in former years, by making up the base work of solid carnations without a bit of green and then festooning over this in the usual manner. Such groundwork, aside from the useless waste of material, is objectionable also from the artistic standpoint, as such a piece will always look stiff and clumsy. Still we sometimes find a customer who will insist on such an arrangement as he imagines it looks richer. In such a case we had better humor our patron, but be sure to figure in your price the additional amount of stock to be used.

Now for the finishing of our design. From the first step of tinfoiling and mossing up to and including the base work requires no great skill and is purely mechanical work in its nature. A little practice will soon enable us to accomplish it in a satisfactory manner but when it comes to finishing or, as we call it, festooning, we are called upon to use a little taste. Not every florist is a born artist, but if he possesses a love for flowers and a liking for the business, no matter how little natural taste he may have he will with time and practice prove himself a pretty fair hand in this line of business.

In illustration No. 3 we show the cross in a finished condition. Our object was to have this design made up in such a way as to show every flower to the best advantage and to use no more material than is absolutely necessary for effect.

Illustrations of flowers, particularly those of designs, obtained by the photographic process, are not always what we could wish them to be. The adiantum used in the design shown throws a shadow over the flowers placed behind it and therefore hides some of them from view.

The material used in this cross is all second grade stock and selected purposely of such kinds as are most commonly used for such work at this time of year, such as cull roses, Romans, valley, freesia and alyssum, with a finish of adiantum.

We have already treated the subject of stemming in a general way but will find it necessary to refer to it again from time to time as the various kinds of material used for different purposes are passed in review. It is difficult to state just how long to leave the stems of the flowers to use as festooning in small flat designs such as we have under consideration. Judgment will have to be used to some extent, as the nature of the material will have to be taken into account. Valley and Roman hyacinths wilt quickly and we should be careful to run the stems by means of the pick, into the moss, or at least bring the stem closely up to it. This should in fact apply to all other flowers as well. In stemming lily of the valley always wire in a leaf with the flower, but don't place the leaf too high; the flower should show well above it. As regards foliage for finish, adiantums in various forms are undoubtedly the best for our purpose. A. cuneatum being the most common in our market is at the same time one of the very best, a variety useful in many other arrangements as well, and should always form part of your regular stock.

Our fourth illustration shows a wreath of crescent shape made with the same class of stock with the addition of a few Harrisii lilies and a bunch of marguerites. The process of putting up such a design is nearly the same as that of the cross with the exception that no carnations or other flowers are used as a base, but all the flowers stemmed long and arranged loosely.

As the season varies so also will we find different varieties of flowers as we pass from winter into summer. Almost everything in the shape of white, cream or delicate pink will come in handy. In winter in addition to the varieties mentioned in connection with our illustration the camellia is largely used with very good effect, as is also Eucharis amazonica. In summer we can make good use of the hollyhock, gardenia, aster, tuberose, and if hard up for material may press the balsam into service. Roses and carnations we have with us always. Of the former Niphetos is the best variety for this class of work, particularly in the summer season, but we need not confine ourselves to white alone. There is no objection to the use of delicate cream or pink in funeral work, and although we may find sometimes that objections are raised against anything but pure white, still the majority of flower buyers prefer an arrangement with a shading of color, to that of dead white alone.

Ants.

Will some member of the craft kindly give information as to the best way to get rid of ants, both out and indoors, and oblige A CONSTANT READER.

Flowers and Their Colors.

There are certain facts about colors in relation to flowers which it seems essential for florists and horticulturists to know. Sometimes it happens that someone who is directly interested in science (particularly in reference to its dealings with color) scoffs at the idea that an artist must by force of his natural gift possess any scientific knowledge of color. Science we know means in a couple of words, *truth* attained by a *methodical* course of study. The artist is the man above all others whose work is characterized by *method*. In the course of his work he must by necessity become acquainted with innumerable facts connected directly with the nature and operative influences of color. As a matter of fact all we know about color has been taught us by the scientist and artist. Still there is more to learn in the very simplest directions; yet we hear less about the simplicities of colors nowadays from artists and scientists, than we hear about the complications which naturally arise from its infinity!

We want to know *first*, what red *is;* we are not so particularly interested about queer things connected with it. We want to be sure *what* is really a simply red flower; we do not care particularly about the color pigment contained in its structure! In fact the visible conditions of color are what we want to know about, first and last.

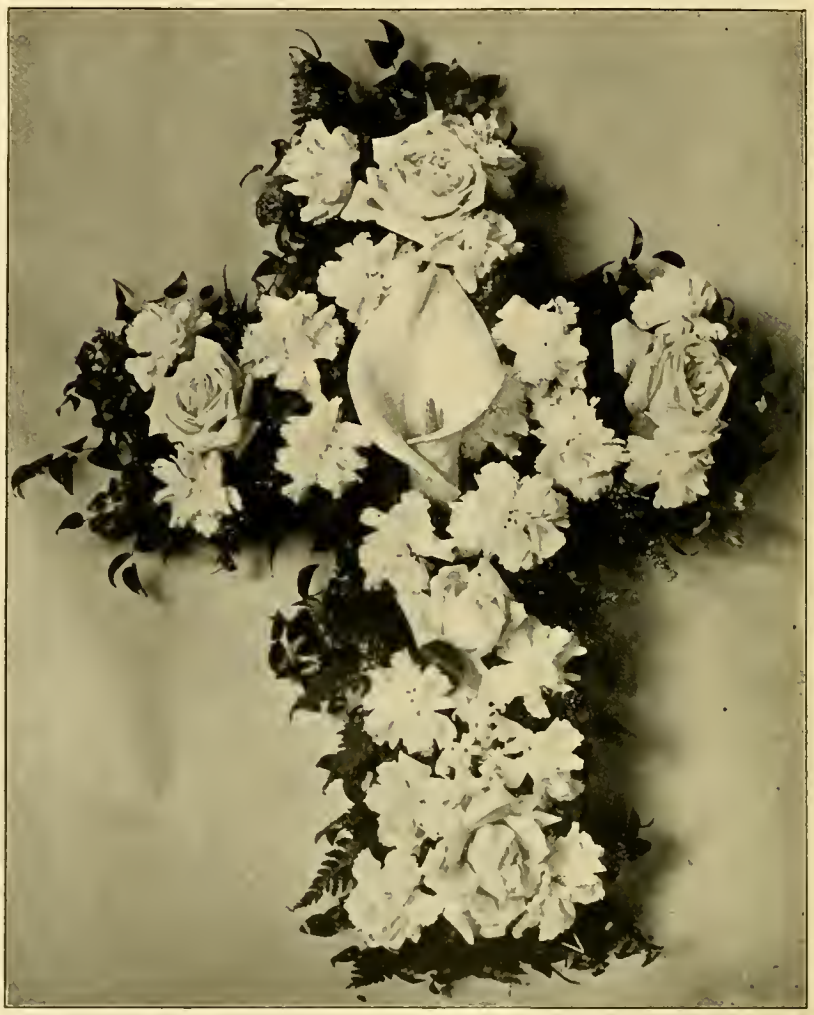
We will admit at the start that there are four simple colors,—yellow, red, blue, and green. Before we go any further we must find out what is exactly red, or yellow, or blue, or green. Here comes difficulty immediately, because there is no standard to which people universally refer. But after a careful and scientific examination into the matter there is no doubt but what the four colors mentioned may be found pure and simple enough in the following four tangible objects, viz: A lump of yellow sulphur, or a lemon yellow African marigold; aniline pigment called rose cathame (when in dry lumps), or a Portia carnation; the zenith blue of the sky on a clear day, or the pigment called cobalt blue (also in dry state); and the pigment used by artists known as emerald green, or the bit of bright color at the top of the stem of a calla. These objects are so close to the truth so far as simple color is concerned, that it would be next to impossible to procure any substitutes which would improve on them. I do not say that the above objects are perfect representations of the four colors, but I do say that they will serve the purpose.

It will be noticed that I do not name a blue flower; there is no representatively blue flower. Perhaps the forget-me-not is the nearest approach to one, but its color is weak and not quite right in quality.

Now, having settled upon something definite as regards simple colors, we may proceed with the examination of other colors *less simple* yet quite common. The familiar names—crimson, magenta, solferino, scarlet, pink, maroon, purple, violet, lake, carmine, and ultramarine, all seem to have no definite limitations in the minds of people who have constant recourse to the use of such terms in trying to explain the color of a given object. Thus, in a half dozen floral catalogues before me, I find the term scarlet used improperly; it comes hit or miss in all six cases; in fact I can take it for granted that what is called scarlet usually means a bright red without much regard for its actual quality! The Madame Crozy canna is a pure scarlet flower, its *quality* of color, in a word is scarlet, and I may say the same thing of the King of Tom Thumbs nasturtium, although its force of color is different. However, both of these flowers are in color characteristically scarlet. It is a fact that there is no scarlet present in either balsams or phloxes! These two families (so far as practical cultural results are concerned with them to-day,) are incapable of producing scarlet flowers. Yet I find in all six catalogues a "scarlet phlox."

Now, I will admit that I am aiming for uncompromising accuracy, and that so far as this is concerned, there is nothing absolutely necessary about it, so the flower seeds sell and those who buy them know pretty well what they are getting. But at the same time a little more knowledge of color would greatly help both the selling and purchasing parties; and it must be admitted that absolute unanimity of opinion in regard to scarlet would be a great advantage. When, for instance, one buys a packet of seed labeled Yellow Phlox Drummondii, and the ultimatum shows a deep cream-yellow flower, one experiences surprise; it follows then, that the name *yellow* meant little or nothing. So-called scarlet balsam may also lead one to believe that the next flower named scarlet by the catalogue compiler will bear the same hue; but again there is surprise in store for the purchaser, and the latest scarlet flower proves itself a clear cherry, or pure red one!

To settle definitely on the true hues of these common but not simple colors, I must describe them scientifically. A little light of this kind will certainly enable us to put our finger on true hues without the slightest danger of error.



Scarlet: Scarlet is a red with a proportional amount of yellow in its composition. The color of red iodide of mercury is a typical example of it. Red iodide of mercury is called pure scarlet. A color which is more orange than red lead and less orange than Chinese Vermilion is *not* called scarlet.

Magenta: This is a color of high luminosity, lying in the spectrum between crimson and purple, and is strong in quality. The color (an aniline or acid one) was discovered in the year 1859 and named for Magenta, Italy. This color is common in petunias.

Solferino: This is a color less strong than magenta but of the same quality as the latter; it was discovered in 1859 and was named for Solferino, Italy. It is sometimes called rosaniline, and is a luminous, rose-purple color.

Pink: This is a color which when pure is a dilution of pure red of low chroma but high luminosity.

Green: This color is improperly considered as a mixture of blue and yellow. It is a *simple* color of the solar spectrum lying between wave lengths 0.543 and 0.511. Emerald green pigment is its best representative, the spectrum of which shows a wave length 0.524. A mixture

ARRANGEMENT OF CROSS Illustration No. 2 [See Page 754.]

ARRANGEMENT OF CROSS. ILLUSTRATION NO. 3. [SEE PAGE 755.]

of blue and yellow only partially and inadequately represents pure green.

Crimson is a bluish red nearer pure red than magenta.

Maroon is a dark red; that is it has black in its composition.

Purple lies between magenta and violet.

Violet lies between purple and ultramarine.

Ultramarine is an intense blue with violet in its composition.

Lake is a crimson red, and carmine is like it except that most of the blue tincture has been separated from it.

All these colors are more or less pure in flowers. Pure red is more or less mistaken for scarlet, but it resembles far more closely what is generally called cherry red. Certain flower families distinguish themselves in presenting one or more strong hues, and absolutely refusing to show some one other hue! as is instanced by the fact that there is no blue chrysanthemum and no yellow aster.

In a later issue I will have something more to say about certain colors which certain flowers are partial to. If we would be sure about correct names for colors in the compilation of catalogues it would be best to point out the pure color tones which particular flower families refuse to recognize.

F. SCHUYLER MATHEWS.

Chicago Notes.

J. C. Vaughan's establishment at Western Springs is always an interesting place to visit, particularly at this season of the year when the houses are filled with thousands of young plants grown for the shipping trade. Under the able management of Mr. Wilson, who has entire charge of the place, the whole stock looks exceptionally fine this year.

One of the first things that caught our attention was the admirable arrangement of the stock house. This house is about 12 feet wide with a three-foot walk down the center. On one of the benches, arranged in alphabetical order, will be found every variety of plant ready for shipment. A space that holds from 50 to 100 2-inch pots is assigned to each variety. The division lines are marked by means of a lath nailed across the bench. On the opposite bench, arranged in like manner, are the different sets of collections such as are offered in catalogues. Over each section and in plain view is placed a sign with the name of the variety; besides every one of the plants is labeled ready for shipment with the printed water proof paper label generally used by those in the shipping trade. This labeling, by the way, is done by a force of young ladies. The employment of female labor in greenhouses is quite an innovation, and the boys had better look out for their laurels; if the fair sex once enters a field there is no telling where they may stop.

The advantages of having a full list of your shipping stock all together in a systematic order is self apparent. A great saving of time will be effected in filling orders. No matter how well posted your men may be in reference to the location of stock, if the same be scattered through a dozen or more houses the time consumed to collect an order will be a great deal more than would be the case by having it in compact form. During the shipping season one man is in charge whose duty it is to keep every space filled.

We noted a fine stock of young plants of the new rose Senator McNaughton. To judge from the stock plants grown in another house, planted on benches, the rose is of good habit and apparently a free bloomer; in fact there seems to be no difference between this and its parent, the Perle, except the color, which is certainly not white but a light yellow; the blooms as seen here are just the shade of Mme. Hoste, a color, to judge from a dealer's standpoint, that hasn't got character enough to make it a good market sort.

Another novelty in roses of recent introduction from England is a new climber, Crimson Rambler. The plants are very thrifty and show a vigorous habit. The blooms are dark crimson, rather small but very double, and produced in large clusters.

Little Gem callas are grown in large quantities to meet an increasing demand. The flowers of this little calla are very useful in arrangements of cutflowers, and can be used where the flowers of the larger forms would be out of place. This variety is a very free bloomer and as the plants take up but little room it seems that it might be grown with profit for the cutflower trade. There is also a form of the yellow calla; this however is of no merit as a cutflower.

In cannas we find every sort of established reputation, as well as the latest novelties. Some 20 new French sorts, exhibited at the Fair last summer under number, are grown here. Of the five varieties that were honored with a medal three are seen in bloom, but as most of us probably saw the plants bloom last summer we will omit a description here. But as awards were made to these varieties under number it may be of interest to give the names bestowed upon them; No. 103 has been named M. Mesnier; 104, Midway; 107, Chicago; 114, Octave Mirabeau; No. 124 is not named yet.

In the palm houses we find a fine young stock of latanias, kentias, arecas, cocos, etc., in flourishing condition. Here we also note some half dozen of fine Dracæna Massangeana 6 feet high and with good healthy foliage from top to bottom. Also a superb lot of Araucaria excelsa imported last fall.

In the stove section our attention is at once caught by the beautiful Strobilanthes Dyerianus, a novelty from England which was awarded a medal at the Fair. The dark green glossy foliage of the plant marked with purplish blue shading to silvery white is very striking. Mr. Wilson informs us that this plant is easily cultivated and is readily propagated from cuttings.

On the other hand Cineraria m. aurea, also a late introduction from England, is not as easily grown, at least Mr. W. finds it rather difficult to manage. It roots slowly from cuttings and seems to make but little headway in growth. This plant, by the way, looks like a variegated form

of Centaurea maritima and we mistook it for such, when first seen.

Gynura aurantiaca, although not a new thing, is not as well known as it should be, while a fine greenhouse plant it is also a good bedder. The velvety purplish hue of the leaves is very striking. The flower is a bright yellow.

O. P. Bassett's place at Hinsdale is noted for two things in particular: Fine roses and early Harrisiis. For a number of years good Harrisiis were cut commencing Nov. 1 and sometimes a week earlier. Mr. Andrew Benson, the genial foreman, don't claim any special merit in producing them thus early. In his opinion the following points are to be considered in producing good early blooms: In the first place in selecting his bulbs he prefers a sound medium bulb, one that will produce from 2 to 3 flowers. These are planted in rather small pots, but as soon as rooted and started to grow, the plants are pushed by heavy feeding. The water, both for syringing and as applied to the roots, is never used cold but of quite a high temperature.

Outside of Harrisiis and other bulbous stock nothing but roses are grown here. American Beauties are Mr. Bassett's specialty, and these are usually finely grown and produced in large quantities. At this time of year of course Beauties don't look at their best, but we still note some very good blooms on long stems.

"I make it a point," remarks Mr. Benson, "to plant Beauties early, the last house not later than May. In this way I get good strong plants by early fall. I prefer to grow them on benches as I do all other roses, planting young stock every year. Last spring we were rather short on young stock though, and we replanted one of the houses with old stock, and I must admit that this house did fully as well as the rest. The last house was planted the latter part of May with stock right out of the cutting bench, and out of this house, by the way, were cut our premium flowers exhibited at last fall's show."

Five houses 170x20, and four 162x20 are devoted to Beauties. The balance of the extensive ranges is taken up by the smaller varieties.

Mermets and Brides are looking fine. A house of the former variety is particularly good, but the Mermet will have to give way to the Bridesmaid. Of this latter variety we find some ten to twelve thousand fine young plants. This sort will be grown extensively next year. Testout looks well but has produced few flowers during the winter months. A more extended trial will be given next year. Kaiserin is also grown in a small way. Mr. Benson don't seem to think very highly of this variety as a market sort. He argues that the blooms which show at their best when partly or even fully open, will be taken by the buyer for old stock that will not keep. We think however that he is mistaken, and judging from the few good flowers we have seen we predict a future for this new rose. In habit and constitution but little fault can be found.

We also note some very good Woottons. The best flowers are produced from 2-year old stock. Mr. B's experience has proved that with him 2-year old plants replanted give the best result, both as regard quantity and quality.

Mr. Bassett's new houses built last summer have the short span to the south. So far as can be judged by this season's experience this plan is very satisfactory. One objectionable feature is that when tall growing varieties, such as Beauties, are grown, the bench on the north side of the house will be somewhat shaded, but if the arrangement of the benches is such as to bring a walk inside of the north wall this objection will in a great measure be overcome. In all other respects this style of building is considered a success. B.

ARRANGEMENT OF SIMPLE WREATH. [SEE PAGE 755.]

Lily of the Valley.

The accompanying engraving is from a photograph of a superb bunch of lily of the valley recently sent to us by Mr. Aug. Jurgens, who is acknowledged to be the most successful grower of valley for the Chicago market. The picture shows the bunch a little less than half life size, the longest spray in the bunch measuring 15 inches in length.

As all cut flower growers know, forcing lily of the valley is one of the most "onsartin" ventures in the business with the majority. One may meet with splendid success one year or several, and just as he is prepared to consider himself infallible an overwhelming and expensive failure knocks the conceit out of him. While probably no rules can be laid down that will insure success there are many little wrinkles that have been employed by successful growers that are good to know.

In answer to questions Mr. Jurgens said:

"In the first place we must start in with first-class plump and sound pips. If the stock has in any way suffered the most experienced grower will be unable to produce a good flower. I think it therefore of the very greatest importance to select A No. 1 pips and have them in perfect condition. There is a considerable difference in the class of roots we import. The superior quality is not always determined by the size but very often the greatest difference is found in the soil where the plants have been grown. For myself, I prefer what is called the 'Berlin pips,' which means a root that has been grown in sandy soil. The term 'Berlin pip' is applied not alone to the valley grown on the sandy plain in and around the city of Berlin, but also to all stock grown in similar soil, as for instance at several points around Hamburg. In my opinion these pips are superior, especially for early forcing, to those grown on heavier soil.

"Having ordered my stock from a responsible grower, I insist upon having it well packed in damp moss. We often find, unless special instructions are given, that the roots are packed into boxes without any packing material whatever. The consequence is that the roots around the sides of the boxes dry out and arrive in a wilted condition. Of course you can swell them out again by soaking with water but the vitality of the pip is greatly impaired. There are other dangers encountered on a voyage across the ocean that we are powerless to guard against. One is the danger of the stock getting heated in the close atmosphere in the hold of the vessel, but on this we must take our chances.

"As soon as the stock arrives it is at once taken out and heeled in in some convenient place where we can get at them at any time during the winter as the pips may be wanted. I dig a trench, say four feet wide and about one foot deep; I then place the bundles of roots in rows closely together and cover with six inches of soil. In this shape they are left until cold

A FINE BUNCH OF LILY OF THE VALLEY. ONE-HALF LIFE SIZE.

weather sets in. I allow the frost to penetrate down to the pips before covering. Unless you get the soil frozen before covering you will find that the pips start to grow before you are ready to use them. The covering best suited for the purpose is either hay or straw, or very coarse strawy manure. Don't put on any manures that will heat, as this will draw the frost out of the ground and start your roots to growing. Sometimes we get a heavy snow fall early in the season, which if left over the beds will prevent the ground from freezing, and in such a case it should be removed.

"Since cold storage of pips has been adopted, we do not attempt to force from the new crop until say January 1. It is difficult to force valley earlier, and grow it with sufficient foliage, but if we start in with January no great difficulty will be encountered.

"There are different methods of handling pips, and each may have its advocates. Some prefer to plant them in flats in soil, and others use sphagnum for the purpose. For myself, I take the roots out of the ground in such quantities as may be desired and plant directly onto the bench in rather fine sand, in rows three inches apart. The roots are then watered thoroughly and covered with sphagnum, sash are placed over them, which is shaded with canvas.

"I grow my valley in a temperature of from 80° to 90°. Although good flowers may be produced by running up to 100°, it is best not to force them too hard if you wish to produce stock that will give satisfaction in the market. Flowers grown in a moderate heat will last longer and furthermore the flowers will be more perfect, as the lower bells on the flower spikes are apt to shrivel if grown in extreme heat.

"After the pips have started to grow the moss is removed and as soon as the lower flower bells begin to turn white the sash are taken off in order to give more air and harden the blooms, but careful attention must be given to shading, and

right here let me state that this is the most critical period, as this is the time when the finish must be given to the flower and foliage which makes it marketable. If shaded too closely the stalks will draw up and the foliage remain a sickly yellow. For shading canvas tacked to a wooden frame will answer very well but should be placed over the beds in such a manner as to allow a free circulation of air. As soon as the sun is going down, towards evening, the shade is taken off and put on again in the morning, or left off altogether in dark and cloudy weather.

"The existing conditions in the market you cater to will determine largely how to finish your flowers. For myself I prefer to grow the flower not too long, rather aiming at a perfect bloom and strong, dark foliage. But I find that as a rule the stock drawn up taller meets with the best demand although the additional length is often obtained at the expense of the flower.

"A great deal in valley growing depends on proper watering. Having watered the roots thoroughly when planted, don't water oftener than is needed to keep the sand or moss from drying out, and stop watering altogether as soon as the flowers turn white.

"Growing valley in summer from pips kept in cold storage is not a difficult matter provided you keep your pips in proper shape. I grow them in a natural way planted in soil on benches. The soil should be very firmly packed around the roots. The house to grow it in should be as cool as is possible to have it, but it must be airy and well ventilated.

"But the storing of the pips to keep them in absolutely dormant condition is the main thing. By trusting them to the care of the cold storage warehouse we often run great risks which may result, as was the case with me last summer, in the loss of a large amount of stock. If the machinery in such an establishment should get out of order, or some other accident should happen, and in consequence the temperature rise to 32° or 35° that would mean ruination to the stock as the pips would start to grow at once. To avoid such risk I built an ice vault for storing my own stock. The roots are packed in boxes of convenient size to handle and left out of doors until frozen through. These are then taken into the cold storage, which is kept at a temperature of 20° or less; never allow it to rise to 30° to 32°; although 32° is considered the freezing point nevertheless the temperature at such a degree will gradually draw out the frost, so let us remember that in order to insure success the roots must be kept frozen stiff."

For keeping his valley blooms after they are cut Mr. Jurgens has an arrangement at once simple and efficient. It consists of a zinc lined wooden box 2x3 feet and 4 inches deep. Over the top is tacked wire netting with meshes about 3 inches in diameter. Each one of these meshes will hold a bunch of 25 sprays. The main point of advantage of this arrangement over that of the pot generally used for holding the flowers, is that each bunch will sit up straight and don't crowd together and as the pan is but 4 inches deep the flowers will not sink down into the water as is often the case, and thereby become water soaked. By keeping the pan filled within an inch of the top the stems will always reach the water.

DO YOU WANT a list of the leading cemetery superintendents? You will find such a list in our new trade directory and reference book.

What Can be Done With Gontier.

The vase of Papa Gontier roses shown in our illustration contains the most remarkable specimens of this rose that have ever come to our notice. The flowers as shown are reduced to one-fourth of their natural size. For length of stem, clean and healthy foliage, as well as size, substance and color of blooms nothing better could be desired. The stems indeed might put those of American Beauty to shame. The shoot just showing bud, as seen at the base of our vase, was cut from a cane just four feet from the ground.

The blooms we illustrate were cut the day previous to their being photographed and have not been "swelled" by keeping in a cool cellar for a week or so. The Gontier above all other roses, as we all know, may be greatly developed in size by keeping in a dark and cool place after cutting, and if handled properly and not kept too long will last fully as well as when fresh cut.

These flowers were grown at the Klehm Nurseries at Arlington Heights, Ill., and are produced from plants three years old, planted in solid beds. We find two houses, each 20x100, which at the time of writing, March 15, are just coming into full crop and are literally one mass of buds. The wonderful vigor and enormous growth must be seen to be fully appreciated. But let Mr. George Klehm tell us how he does it.

"The site," says George, "where these houses are built was originally a vineyard. Tons of grapes have been grown in the very same soil where you now see these roses. The soil is a stiff and rather heavy clay, remarkable in its retentive quality as regards moisture, well drained of course. There was no special preparation of the beds further than to dig holes eight inches in diameter which were filled with a somewhat lighter soil made by adding partly decayed sods, but no manure, and into this the roses were planted. No mulching or top dressing was ever applied but the plants are freely fed with liquid manure.

"During summer the plants are allowed to rest. From July 1 to October 1, not a drop of water is applied. Nevertheless the growth is never entirely checked. The ground will bake as hard as a brick and open fissures large enough to put your hand in but yet the bushes will grow and flower right through the hot dog days. As the moisture in the soil falls lower and lower as the season advances, the roots will follow in search of it to an almost incredible depth, but no attention whatever is paid to them until about October 1, when the plants are taken in hand, the surplus wood cut out and the remaining canes tied down, after which the beds are thoroughly soaked with water, which will be sufficient for the winter with the addition of course of what water is necessary to dilute the liquid manure.

"The houses are kept at a night temperature of 50°, with the exception of perhaps at Christmas time, when the houses may be run from 5° to 10° higher in case the crop should be a little later than desired.

"Growing Gontiers in solid beds you cannot avoid getting them in crops, but as the first of these heavy crops, if you manage right, will be in at Christmas, you will be able to take advantage of the high prices prevailing at that season of the year; the second crop which is now on generally finds us in the middle of the Lenten season, which of course is not the very best time of the year to dispose of them, still if the stock is fine they will net about as much as most of the larger teas, and never go begging on the market. Doubtless more blooms can be produced when grown on the benches, but when it comes to size and quality I prefer solid beds.

"We have grown fairly good Gontiers for a number of years, but nothing quite as good as this year. I think that the use of rain water has a good deal to do with it. Until last summer, when our system for storing rain water was completed, we were dependent on well water alone, but now we use only the former, as we have an almost unlimited supply."

This system of storing and distributing rain water is quite interesting. The main cistern is located under the floor of a large storage house adjoining the greenhouses. This is a structure 110x26 feet, built of stone and brick and the cistern covers the entire floor area and is 6½ feet deep. Connected with this main reservoir are three distributing cisterns, two for the use of water and one for diluted manure water. The latter again is connected with a fourth one containing liquid manure which draws its supply from a fifth one located in the barnyard. The whole system is operated by a steam force pump. The distributing as well as the main reservoir are directly connected with the gutters that carry off the rain water from the roofs of the houses. When full the smaller cisterns, through an overflow pipe, discharge the water into the main reservoir, when empty the needed supply is again drawn back into them by means of the pump. A steam pipe is run through the distributing cisterns, which heats the water to a desired degree.

The manure cistern, as stated above, is located in the barnyard about 100 feet distant from the houses. This is 12 feet in diameter and 12 feet deep, vaulted over, with an iron grating. On this is placed first brush and then some coarse straw onto which the manure is piled. If the rain fall is not sufficient water is pumped onto the pile to furnish the desired amount of liquid. This liquid manure, after passing through a strainer, is led by means of a sewer pipe to the receiving cistern, located in a convenient place under the houses. From this it may be pumped into one of the three smaller cisterns, where it is diluted to the proper strength, and through a hose applied to the beds.

The advantages of rain water over hard water drawn from a well is great, and can't be denied. The cost of building such an arrangement as we have attempted to describe is not a small item, yet if put down in a first-class manner will last a life time, and doubtless will prove a paying investment in the end.

How Many Men to Employ.

With reference to the inquiry from your correspondent "Rosegrower" as to the number of men it should take to run 9,000 feet of glass, would say that it somewhat depends upon the material grown, which your correspondent does not state; however, taking it for granted

PAPA GONTIER ROSES. ONE-FOURTH LIFE SIZE.

that it is a general florist place, growing roses, carnations, etc., would say that three good, active men, paid a fair wage, ought to be able to run it unless intricate plants, such as palms, etc., are grown. These require considerable more labor than such things as cut flowers, roses, carnations, etc.

Your correspondent's question opens to me a subject upon which many growers in the country have spoken to me, and I am afraid that a great many of our florists do not appreciate the fact that a man earning, say $1.50 per day, if he can produce for his labor, say $2 a day, for his employer he is earning a good percentage on his wages. To run a place with insufficient help means a loss both ways; it means a loss in the amount of material that the greenhouse can be made to produce, and a loss in the quality of the same. The florist business, like all others, must be run to the very best point possible to get the best returns for the same. Take for illustration, second quality roses to-day in all the leading markets of the country I believe are selling for about one quarter of the amount received for A1 quality, and where a place is run with insufficient help the second quality will be the predominant product. Even supposing that the plants get a reasonable amount of attention and are growing well and producing large flowers, unless the stems are straight and strong, the bud standing straight on the stem, they are ranked as second-class flowers. To avoid this it is necessary to have the buds tied up nicely so that in their development they produce straight stems with good, clean foliage and a good, fine flower on the end of it. This will mean that the flower when put in the market will bring anywhere from 25 to 75 per cent more than if sent in to the market with a

crooked stem. All this means additional work and oftentimes in addition to the three men quoted above for running the 9,000 feet of glass a nice, clean, industrious boy could be employed to good advantage, whose light nimble fingers would be of great assistance in keeping all the buds tied up as they are produced so as to make them grow with good stems as above described.

Then, again, there is another point which very many growers overlook, and that is *cleanliness*. They may suppose that because the plants are growing well and are looking thrifty there is no necessity for cleaning up rubbish which might happen to fall under the benches or otherwise collect there, leaving decaying matter to breed fungus, harbor wood lice and thousands of other pests which afflict the florists. If this rubbish is all cleaned away regularly, the houses kept clean and neat, it will not only be a great improvement as to the produce of the place but will add immensely to the pleasure of the proprietor.

A short time since I was visiting two places in one day. In one place you could not find a dead leaf or a weed in all the establishment either on roses grown there or any other plant on the place except a few decaying leaves at the base of the carnations, which it was impossible to get off without destroying his crop; here everything was a pleasure to look at, everything was A1 in quality and the returns, notwithstanding the dull season, were as good as could possibly be gotten from any set of greenhouses. Furthermore, the man contemplates adding another house to his little range this year, possibly two, with the results of his savings from his year's work.

Within a short distance of this man I called upon another; but, woe betide me! I should have gone there first. Look where you would you could see rubbish of all sorts and descriptions; broken pots, old ties, dead leaves and every other conceivable kind of rubbish that could be collected in a greenhouse was scattered all through the place, covering almost the entire surface under the benches. The walks were muddy and, to say the least, one had to wade through many of them with rubber boots on to insure getting through without getting the feet soaked. In this place it was nothing but grumble by the proprietor from the time I entered until I left about the results and the returns his greenhouses were producing. I ventured to suggest to him that a little more labor put into it would help to increase the returns of his plant, but a shrug was all I got and "I can not afford that; I am going to let one of the men I have go within a few days."

The chances of making greenhouses profitable in both cases, in my estimation, were about equal. One was doing it with good management, help enough to keep everything in good shape. The other was trying to run it without sufficient help, with the result as given above, and I fear there are very many who have the same opinion as number two described above.

I am fully aware that in many cases the present season it has been a very hard thing for very many of us to make both ends meet, or in other words get sufficient returns out of the produce of the greenhouses to pay our way clearly, but when it comes to reducing help and think you are going to gain anything by it I do not think any greater mistake can be committed. If our business is worth anything at all it is certainly worth all we can put into it, and the old axiom is just as applicable to-day for us as for any business in the country—"What is worth doing at all is worth doing well."

JOHN N. MAY.

Climbing Niphetos Rose.

The accompanying engraving is from a photograph of a plant of the Climbing Niphetos rose sent us by Mr. F. W. Plummer, Kewanee, Ill. Mr. Plummer writes as follows:

"It is not quite two years old and is planted at one end of a 70-foot house in a solid bed. The plant is over fifty feet long and was full of bud and bloom when photographed (Feb. 4). There hasn't been a day during the last fifteen months that I could not cut flowers from it. It is a very free bloomer with me and the flowers are very large and last well without cutting."

Seasonable Hints.

Before the first of April you should endeavor to put in your main crop of cuttings of a good many useful plants that figure largely in your spring sales, and for which there is plenty of time left to grow them on into the right useful size for whatever purpose they are needed. Ageratum put in now will be just right to have in 3-inch pots by bedding out time, with us the last week of May or first of June. Heliotrope should go in at once and all you want of it. The latter you often see stunted. It should never be allowed to get pot-bound, but should be kept growing continuously from the time it is rooted. If allowed to remain long for want of pot room it is subject to a rust very similar to the verbena rust. Lemon verbena, of which you never have enough should be propagated now, and this is as late as the cuttings will make plants large enough for spring sales. I have heard a great many florists say they found this a difficult plant to make root. I have found it as easy to root as the common verbena providing the cuttings were young and brittle and they be kept continually wet in the sand, and never allowed to wilt from either the bed being too dry or the bright rays of the sun; and that rule applies to most all soft-wooded cuttings.

The common little sweet alyssum (only the double) should be propagated largely if you have much veranda box or vase business, for it is one of the few white flowering plants we have for the purpose, and perhaps you will have noticed there is a sad lack of white in all such work. After they are rooted and remain a few weeks in a 2-inch pot they should get a pinch and a shift into a 3-inch and be put into a mild hotbed where they will make fine plants for the above purpose. Don't forget German ivy, so-called. Common as it is, it is one of the most useful droopers we have for boxes, etc.

Anthemis coronaria sells well when in bloom but is not a very satisfactory plant. It should never be used in vases or baskets and only where it has unlimited root room. It roots most freely and quickly, makes a bushy little plant covered with its bright yellow flowers. The common white feverfew and Salvia splendens are two other plants that can be rooted now and for which there is always a good demand for mixed borders, etc. I am putting in a large lot of chrysanthemums just now. You can't wait any longer, for the old stock plants demand it. Chrysanthemums are propagated all the time from January until August. Those propagated about end of April are the most useful size for planting on the benches to produce two or three good flowers each or for planting on a bench with the intention of being lifted in September for moderate sized pot plants. Those struck now, if kept growing and not allowed to get hard wooded before going on the bench in May or June, will produce the finest flowers. Mind, I am not pretending to write for those who grow exhibition plants. They have been taken care of long ago. Remember the valuable point that Mr. Wood gave us last summer, and that is that chrysanthemum cuttings in the summer, or when there is little heat in the sand and the weather is warm, should be kept saturated; twice a day on bright days is not too often to give the bed a good soaking.

If your propagating house is exposed to the sun there are different ways of shading it. One way is to give the glass a coat of lime or naptha and lead. The trouble with that method is it is there when you want it and it is there when you don't want it. Many cover the cuttings with papers. That I believe is very objectionable, as it does not allow a free circulation of air around the cuttings, and would be just the right conditions to produce anthracnose, which carries off so many thousands of cuttings every year. I use for shading the cutting bed a covering of cheese cloth. It is just the thing; it gives subdued light without heavy shade. Nail a strip of wood to the posts of the greenhouse 9 or 10 inches above the cuttings and projecting to the front of the bed; on these tack a strip of wood running lengthwise of the house, to which fasten the cloth; on the front the cloth is fastened to another strip of wood—if round so much the better; this is to roll up the cloth when you don't need it and keep the same in place when you do. By this means you can shade during those hours and days when shading is necessary and not otherwise.

About the 20th of this month is a good time to sow the most important annuals, asters, phlox, balsams, ten-week stock, etc. Unless you raise any of these in very large quantities a convenient sized flat is the best for the seed, in two inches of soil. It is very advisable to well soak the seed boxes or pots, or rather the earth in them, before sowing the seed. Then when the seed is sown and a slight covering of soil put on a very slight sprinkling suffices, and there is no danger of getting a large proportion of the seed washed into the southwest corner or any other depression. Don't sow Cobæa scandens until the first of April or they get too long and troublesome.

The 2-inch pots of money vine and glechoma that have been wintering in a cold frame should now be brought into the houses. After a few week's growth put them into a 3-inch. They are almost weeds but they come in very useful for the purpose for which they are adapted.

As soon as you can handle the little plants of petunia from the seed boxes they should be carefully put into 2½ or 3-inch pots, 7 or 8 plants in each. If allowed to stay long in the seed pans they are very liable to damp off or draw up weak.

Don't forget to watch your Japan lilies that have been under a cool bench for two or three months. They won't all start at the same time. As soon as any of them have made a growth of a few inches they must be given the light in a cool house.

Cannas of all kinds should be started by this time. Caladium esculentum there is no hurry about. The first week of Apri

CLIMBING NIPHETOS ROSE.

is time enough for the latter. You will save valuable bench room for several weeks by putting both of these in flats of sand and place the flats on the pipes. The caladiums especially will start in one-third the time they would if put into 5 or 6-inch pots in soil.

The extraordinary fine and mild weather we have had the past three weeks has upset the Easter crop calculations of more than one old head who professes to know all about it, and with a good many the question will be how to keep them in good and saleable shape for another week. Tulips are greatly benefited by being under a cool bench for a few days after about fully grown. They wilt less when cut and much increase in size and quality. After being fully developed you can keep them a good week this way. The same can be said of narcissus and hyacinths. A good heavy shade and the ventilators up both day and night will help much to retard or keep, if well in flower, such plants as lilies, azaleas, lilac, cytisus, deutzia and others. It is a little early yet to put on a permanent shade, and perhaps the crops coming after these will want all the sunshine we will get for a month or two. A very cheap but effectual shading can be put on by getting a little pure clay and with water enough to make a wash thin enough to pass through a syringe you can shade a house dense enough for the purpose in a few minutes. A heavy rain will wash it clean off and if the rain don't come soon enough to suit you one application of the hose will answer the same purpose. Under these conditions I have been holding a thousand Bermuda lily plants almost in a state of "arrested development" for the past 10 days ready to open at my command.

[The above notes were intended for last week's issue but owing to mechanical difficulties, we were unable to get them into that issue. The following are written for this week.—ED.]

For a few days after Easter the greenhouse will have a very dilapidated appearance. If all your Easter crop could be clean sold out and carted away it would be a blessing, but it can't be so, and there will be always more or less plants left over or hacked about. It is most fortunate always when Easter comes early for you have the more time to get your spring stock in shape. If you have plenty of outside space on your place there are several plants that can be used to advantage. Spiræa Japonica if planted out in the ground is as hardy as a pic plant and will yield a crop of flowers every June which come useful; but if you don't have that chance to use them don't attempt to keep them over to force again; they are so cheap it would never pay. Harrisii and longiflorum lilies if treated decently, that is kept natural and with a moderate amount of light, will well repay to plant out in May or end of April. In July and August the majority of them will send up a spike of flowers. I never could see any profit in saving the old bulbs for forcing purposes.

If you have any cytisus unused and past their prime, cut them, or rather trim them, back to compact heads, and keep growing.

Don't forget to pinch off the old seed pods of azaleas as the petals drop off. If you don't do this it retards the young growth which furnishes the flower for another season. After a few weeks the azaleas that are carried over should have a much warmer temperature than you have been keeping them in and receive daily syringing and encouraged to grow. And don't be afraid to pinch off any shoots that are making an extra strong growth. The object is to keep them compact and they will stand a lot of pinching.

If you have the use of an ice house it will be found a very profitable piece of work to put away a lot of your flats of Von Sion and such tulips as La Candeur, Tournesol, etc., in a temperature of 35° to 40°. They will come in most valuable at Decoration day. But do it at once as this wonderfully early season will soon have them in bloom if out of doors. Last year I put away several thousand Von Sion in this way and brought them out 10 days before I wanted them in flower, and extremely useful they were.

WILLIAM SCOTT.

DO YOU WANT a list of the leading park superintendents of America? You will find such a list in our trade directory and reference book.

PLEASE mention the AMERICAN FLORIST every time you write to an advertiser in these columns.

Carnations.

We are now getting into planting-out time, and it is well to have everything in readiness, so that when a favorable opportunity comes we can take advantage of it.

The first thing is if you have plenty of land from which to select your plot. About the best plot you can select is a good piece of sod, the older the better, with one exception, and that is if you are bothered much with cut worms. In this latter case it is better to take a plot that has been bare the whole winter.

The next thing is to see that it is manured properly, and right here is where a great many differ. I prefer to use good stable manure that has been heaped the summer before and turned once or twice. This should be used in accordance with the requirements of the soil; if rich a very light coat and if poor a good heavy one will be required. This manure question is really of great importance, and it is best to err on the poor side, as you can help yourself out then, but if you get too much on and a very wet season turns in, your plants will get so big and soft that it will be almost impossible to handle them in the fall.

In some soils or some sections of the country phosphates are used with good success, but I would advise all who do not positively know that they are good for their soil to go very slow and make an experiment on a small scale one season before using them to any great extent. More than one grower has learned to his sorrow that phosphates and his soil did not agree, or that he did not thoroughly understand the use of them in connection with carnations.

After distributing the manure plow it under and harrow your patch well. When you are ready to plant take a shovel plow and throw up rows about two feet apart. If properly done they will be about six inches above the level; then let a man go along with a rake and rake out all the clods and level them off. This is quickly done and will give you a nice even surface to plant on, about two inches above the level. With this kind of a row you can laugh at spells of wet weather that prove so injurious sometimes in the early part of the season. On these rows the plants are put from six to ten inches or a foot apart according to their growth, the object being to give them plenty of air on every side, and so they can be nicely worked and kept clean.

In regard to the time of planting you will have to be governed by the hardiness of your plants; if they have been well hardened off a light frost is no injury, in fact it is a benefit. If they have been grown rather warm it is best to wait until all danger of frost is over.

A. M. HERR.

Snails Among Carnations.

Replying to the inquiry about snails there is only one practical way to get rid of these pests, and that is to catch them and kill them. This can be done by going over the houses after night and gathering them in by hand or placing lettuce leaves on the beds or benches and in the morning you will find them congregated under them and they can then be gathered up and destroyed. Sliced apples can also be used for this purpose, and salt if used on the beds sparingly so as not to injure the plants will kill them. Houses infested with snails should be thoroughly cleaned up during the summer season so that they do not lodge under boards, etc., and breed. A good fumigating with sulphur and giving all the benches and boards a coat of whitewash is a benefit in every way and will help keep them out.

A. M. HERR.

CYPRIPEDIUM X GRAVESÆ.

Cypripedium Leeanum Giganteum.

The cypripedium honored with the name of Leeanum was received with much pleasure and surprise when exhibited before the Royal Horticultural Society of England early in 1884, and without the slightest hesitation it was unanimously awarded a first-class certificate, a merit which it justly deserved. Two years elapsed and another improvement appeared, viz., C. Leeanum superbum, much larger and more vividly marked than its congener; this also was in due course placed before the society for their consideration, coming from the Dell collection near Windsor, England, and owned by Baron Schroder, and also secured a first-class certificate.

Since that time several very distinct forms showing more or less variation have flowered, but the variety here figured exceeds them all and possesses a title which it worthily bears, viz., C. Leeanum giganteum. In size it far exceeds any variety yet flowered; its dorsal sepal measures 2¾ inches across and is almost round, the predominating white being purer than in any other form and the dense purple spotting confined to the median line, which at once distinguishes it from C. L. superbum. It was obtained from the reverse cross of the latter, C. Spicerianum being the seed parent, the pollen coming from a fine form of C. insigne punctatum violaceum. It was recently seen in flower at Orange, New Jersey, in the collection of Henry Graves, Esq., and was much admired. Its free habit, extraordinary size and appearing during the winter season, have made it a great favorite. It requires the same culture as is given to the ordinary form, viz., ample water during the summer months, gradually reducing the supply as winter approaches.

A. DIMMOCK.

Cypripedium X Gravesæ, N. Hyb.

(*C. Argus X C. Niveum*)

The foliage is beautifully tessellated with deep green on a white ground, 4½ inches long by 1½ broad; flower scape a foot high, bearing two flowers each 4½ inches across; the concaved dorsal sepal is white, veined with pale green and tinged with vinous purple; petals 1 inch broad, rich vinous purple shading to white near base, where it is veined with pale green, the whole dotted with violet purple; pouch contracted at aperture and somewhat inflated below it; the front portion is vinous purple, the balance white with faint green neuration, the infolded lobes and interior dotted with purple; staminode pinkish white with green reticulation. The name is complimentary to Mrs. H. Graves, Orange, N. J. The flower is one of the most beautiful of the concolor section to which it belongs.

ROBERT M. GREV.

CYPRIPEDIUM LEEANUM GIGANTEUM.

Hardy Rhododendrons.

The rhododendron is one of the most beautiful of all our hardy shrubs, and should be planted more extensively than it is, but the trouble has been that planters have purchased imported stock, which have infused in their veins too much of R. ponticum blood, which is not, and never will be hardy in the northern states. After two or three trials growers give them up in disgust. Now to get a perfectly hardy rhododendron we must have a greater preponderence of R. Catawbiense and R. maximum blood, and to this end some of our most successful rhododendron growers have labored for years, trying to get a perfectly hardy rhododendron, one that can be depended on in our northern winters, and now you can get plants that are hardy as an oak. Another point, if generally known, would save planters much expense, and make as fine an effect, when planting large masses of these plants on banks or ravines is to use R. Catawbiense seedlings for the bulk of the masses, and a sprinkling of the named sorts for the highest colors.

In planting rhododendrons it is best where practicable to take a position sheltered from the heavy winds, also bear in mind that they like a little shade, for in their native habitat they are always shaded by trees or rocks. While they will do in dry places they like a moist situation, and grow much freer in it. By moist I do not mean where the water stands on the ground, but on the edges of ponds and streams. One word of advice: don't buy of importers, buy of some good northern firm who make a specialty of these plants. While they like peat or mould they do equally well in any good loamy soil, and the first season should be mulched with any convenient material except manure to keep the roots moist and cool; after that they can take care of themselves.

For the edging or bordering of clumps or masses of the strong growing species the little Alpine rose, Rhododendron ferrugineum is most useful, but have been but little used on account of their scarcity and the high prices that have heretofore been charged for them. The Alpine rhododendrons only grow about two to three feet high, and have small hairy leaves of dark green or bronzy green color, the leaves about the size of those of the box plant, and form dense round bushes, which are a mass of blooms in their season.

R. ferrugineum, Alpine rose, flowers in umbels; in color scarlet marked with yellow dots, corolla funnel shaped. Blooms from May to July. R. ferrugineum albiflorum, the white flowering form, is very handsome; one of the rarer ones. R. ferrugineum arbutifolium is a variety with pink blossoms and small glossy foliage. R. ferrugineum hirsutum is a very dwarf species, never exceeding two feet in height, very dense habit and free flowering. The flowers are pale red or scarlet produced in umbellate corymbs. A very good species for decoration of rock work.

The following are the best of the hardy varieties; all of them have been thoroughly tested in New England for a number of years: Speciosum, light pink; roseum superbum, late, rose; roseum pictum, rose yellow eye; roseum elegans, fine rose.

Purpureum crispum, purple, crimped; purpureum elegans, fine purple; purpureum grandiflorum, large showy purple; Perspicum, clear white, good; Minnie, white, yellow eye, very fine; macranthum, large rose; Lilacina, lilac blush, good; Lee's Dark Purple, very dark purple; Grandiflorum, rosy crimson, extra fine; Album, good, white; Album Elegans, very large white; Album Grandiflorum, white and blush; Chas. Bayley, cherry red very good habit; Giganteum, very large rosy crimson; Delicatissimum, white and blush; Blandyanum, bright cherry; Candidissimum, fine pure white; Amarantinora, light rose, extra good; blandum, white and yellow; Everestianum, rosy lilac, crimped very fine.

In conclusion would say do not try, if you live in a latitude north of Washington, to grow the very fine English hybrids of the Ponticum type, or you are bound to be disappointed, for they have so much Nepaul blood in them that they will succumb to the winter; if they don't go the first they will grow gradually weaker until they die altogether, but get the hybrids of R. maximum and R. Catawbiense and you will succeed in growing this, the most beautiful of all our hardy flowering plants.

JAS. S. TAPLIN.

Hackensack, N. J.

The New Mushroom.

Mr. Chas. Hurn of Scarsdale, N. Y., writes us that he feels morally certain that the new mushroom described by Mr. Wm. Falconer in his essay before the Mass. Hort. Society, from which we printed extracts in our issue of February 22, is the same as one he grew some six years ago and which he obtained through English brick spawn. He was very much afraid of the stranger, though he found by experiment that the mushrooms were not poisonous. It was a very rank grower, and while the variety was not poisonous, he didn't take to it, and most decidedly prefers the old campestris. He saw some of the new mushrooms at the New York Florist Club's exhibition last November, and in them feels sure he recognized his old acquaintance, and questions the statement that it is a new species.

In view of the fact that the whole matter has been thoroughly investigated by Prof. Chas. H. Peck, our leading scientific authority on fungi, who upon careful scientific comparison pronounced it a new species and named it, we feel certain that our correspondent has been misled by a superficial resemblance. Our scientists in literature and herbarium specimens have as ready access to the fungi of England as the botanists in that country have, and as Professor Peck has found this mushroom to be a newly discovered spe-

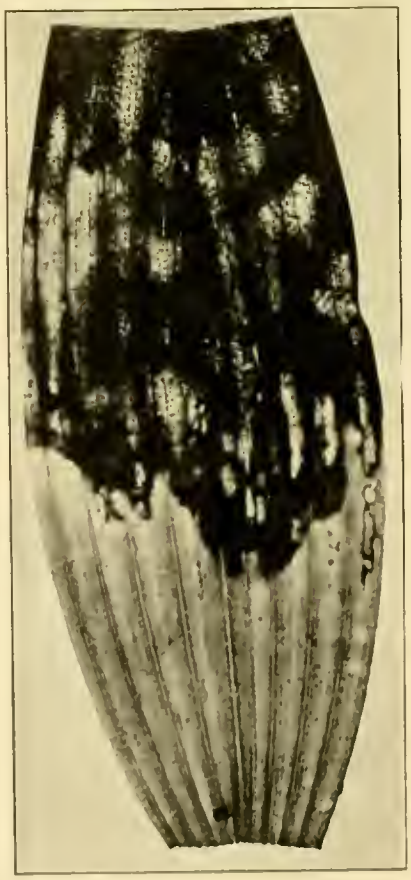
cies in this country, we may rest assured it has not yet been discovered in Europe, where edible fungi are more generally sought after than here, so the presumption is that it is strictly an American species.

Tip Blight of Ornamental Ferns.

It is no new thing for those who grow ferns under glass, and this includes all who have one or more in the bay window, to complain that their pets become brown at the tips and thereby lose much of their green freshness, or fresh greenness. There may be many causes for this unsightly appearance.

In the first place let it be understood that the tips of plants are the most tender portions. It is there that new growth takes place, and on that account the cell walls are thin and easily influenced by ontoward circumstances. These unfavorable surroundings may be an insufficient water supply at the roots, when the tips of the fern plant will wilt, and if the neglect is prolonged the young part dries out and dies. It may be that some poisonous gas finds its way into the air surrounding the room and thereby the plant is injured. Extremes of heat and cold in like manner may be the means of checking the vital action at the most susceptible point, and as a result the tips of the delicate fern become brown, curl up, or even fall away.

There is still another reason for this injury so often met with, and because none of the above deleterious conditions obtain it is all the more mysterious and difficult to remedy. The germs of low forms of life are probably present in the atmosphere at all times. Being microscopic they pass unheeded, and only their effects are noticed. The various forms of contagious diseases of man as the cholera, yellow fever, consumption and a long list of maladies of domestic animals are due to these germs, which multiplying with great rapidity in the victim cause death. Plants are not exempt from these or similar germs, and show their susceptibility in the various forms of rots, blights, etc., that are constantly met with. Our ornamental ferns do not escape, and the dying of the tips is frequently a case of destruction due to the growth, in the fern frond, of an organism that, acting as a parasite, feeds upon the vital fluids at the centers of life and cause the tips to turn brown and die.



The accompanying engraving is made from a sun print of a portion of a plant of one of the most ornamental of our ferns, namely Pteris cretica var. magnifica. This particular spray was chosen for the picture because it illustrated the dead patches as often being below the tip. As a rule the blight is confined more closely to the tips than in this specimen, and serves a double purpose, namely to show the injured extremities, and how the same fungus may make its attack elsewhere and produce the same results in the older and stronger tissues of the fern frond.

We are now ready to glance at the nature of this microscopic destroyer. It starts from a minute body, the spore, which coming from some blighted spot begins to grow by sending a slender thread into the fern. This spore may be carried by the wind, or perhaps more frequently by the water that flows from a diseased place to a healthy one in the process of watering. No change is seen in the fern for a few days after germination, but all this time the fine threads from the spore have been growing in the substance of the frond. The first thing to be observed in the history of a blight like this one is a loss of the green color in the frond, soon

BLIGHT OF ORNAMENTAL FERNS.

followed by the appearance of the ashy gray spot surrounded by a border that is neither gray nor green, purple or brown. So soon as the light disfiguring spot appears, minute pimples form in the blighted area, and these bear the spores similar to

SOBRALIA LEAF BLIGHT

the one with which we started in our outline of the development of the fungus. These spores are produced by the million in these spores-cavities, and when matured are ready to be borne to new healthy places on the same or a neighboring plant by the currents of air or moving water.

Let it be thoroughly understood that the spots upon the fern, at least like those shown in the engraving, result from the presence and growth of a minute plant. Let it be also remembered that it produces what answers to seeds, that these are microscopic and exceedingly numerous, and are disseminated by means of air and water. It follows therefore from this that a sick plant is a source of infection to its neighbors, and should be either removed or have its blighted portions destroyed.

These spore-like seeds can be killed by contact with certain chemicals known as fungicides. Therefore it is possible to check the spread of the blight fungus by placing a chemical upon the surface of the plant. This can be best done by spraying with some compound of copper, as the Bordeaux mixture, or some other of the standard fungicide solutions. The spraying of healthy plants may prevent the spores already upon the surface from germinating, and a like treatment of spotted plants may kill the spores as they are forming.

It is seen that while the fungous enemies are the most obscure they admit of being known when studied with the compound microscope, and successfully treated to prevent them if the spraying is done thoroughly and promptly when the plants show signs of spotting. There are fungous diseases that when far enough along to show their presence are too far advanced for the application of remedy, the whole plant being sick to the heart. But the blight (Phyllosticta) of the fern is not one of those.

BYRON D. HALSTED.

RUTGERS COLLEGE, March 5, '94.

A Sobralia Leaf Blight.

There are several fungous enemies that prey upon the orchids. Sometimes the pseudo bulbs are attacked and quite large pits are produced in them. Again the foliage suffers greatly as in the bletias and still more general and damaging is a spotting of the blossoms.

The particular trouble to be mentioned here—and one needs to single out some special case when a fungous disease is to be treated, is the one of the sobralia. Not long ago during a run through a commercial greenhouse a number of plants of Sobralia macrantha were found the foliage of which was practically ruined. Specimens when afterward subjected to microscopic examination showed a clear case of the destruction by a fungus.

JOHN A. PETTIGREW.

The blight is due to the inroads made upon the leaf by an anthracnose of the genus Gloeosporium (G. Cinctum, B & C.) This is another case of the fungus most frequently flourishing at or near the free end of the leaf and spreading from them toward the base. The accompanying engraving shows a badly diseased leaf in its middle portion, the upper half or more being ruined by the fungus and the lower portion comparatively healthy while the line of advance of the disease is well defined.

When a sobralia plant bears leaves like the one shown it is evident that no amount of spraying will effect a cure. The spores are being produced in great numbers and carried off with every drop of water that drips from the foliage after watering. In other words such leaves are propagating the disease in a wholesale manner and there are various ways for the germs to find lodgement upon neighboring healthy plants.

Spraying with Bordeaux mixture or other fungicides will assist in preventing the spores from germinating upon healthy plants, but in addition to the spraying the source of infection should be removed. When a plant is badly affected with an anthracnose the fungus is usually spread all through it and not simply in the leaves, and there are many chances against ever saving the plant even by severe pruning. In many cases it would be folly to attempt to propagate from such plants with the hope of getting healthy plants.

BYRON D. HALSTED.

AMSTERDAM, N. Y.—J. C. Hatcher has opened a very handsome store at 33 Market St.

John A. Pettigrew.

We present herewith a portrait of Mr. John A. Pettigrew, under whose superintendency Lincoln Park, Chicago, has acquired a national reputation as an ideal city park.

Mr. Pettigrew was born in England about 50 years ago. He is the son of a gardener and began his own experience in gardening when 10 years of age. At the age of 22 he came to Chicago and for 13 years following he was engaged in the various branches of horticulture, mainly floriculture and landscape work. He then entered the stone business, and contracting, which he followed for a number of years, but returned to his first love again and was soon after appointed superintendent of Lincoln Park, in which position he has made a most enviable record.

His varied experience in all the various branches of horticulture, coupled with a sincere affection for every tree and plant in his charge, his splendid administrative ability, together with his knowledge of landscape architecture as well as gardening, made a rare combination and enabled him to meet with brilliant success every one of the problems that continually present themselves in such a garden as Lincoln Park. Withal he is a gentleman with all that the name implies, a botanist of ability and a close student of all that affects the profession he loves.

Many of those who have visited Lincoln Park will probably be surprised to learn that nearly all its beauties of vegetation are growing in a thin veneer of made soil laid over a waste of sand. Mr. Pettigrew's first work on taking charge of the park was to deepen and strengthen this soil and to his continued efforts in this direction may be attributed the salvation of the park. He it was who added to the park those prime attractions the beautiful ponds of aquatics and the garden of hardy perennials.

His latest work of special note is the treatment of the artificial beach carried out into Lake Michigan along the shore of the park. Along the drive, on the side toward the canal formed between the old shore and the new beach he has filled in with soil in which extensive plantings have been made, with phenominal success considering the artificial conditions that had to be overcome. This triumph of the gardener's art over apparently insurmountable adverse conditions, if properly followed up in the future, will prove a lasting monument to his genius.

But now this man, whose great ability has given him almost a world wide reputation, must leave his work unfinished at the behest of a gang of political heelers who have managed to obtain a strange influence over the governor of Illinois, and despite the vigorous protests of every reputable citizen of Chicago, and the entire daily press of the city regardless of political bias.

It is a sad reflection upon our institutions that the most despicable elements of society can so work upon the ambition of political aspirants as to make them utterly regardless of public opinion and the public weal. From the present state of the public mind there can be no doubt that the governor's act will be most vigorously resented at the next election but in the mean time the harm has been done, an unusually able man has been sacrificed, and some "political engineer," to quote one of the dailies, will have had two years in which to ruin the park.

There is still some slight hope that the storm of indignation from the organs of his own party may make the governor pause but he has now gone so far that there is but little to base hope upon.

New York.

The all-absorbing topic for the present is Easter. Growers, wholesalers, retailers, fakirs, all have their interest and their hopes centered in the coming festival and predictions are as numerous and conflicting as are those preceding election day. One thing all are solicitous about, that is the weather. March came in like a lamb and has behaved in an exceedingly lamb-like manner up to date, and great is the fear that the proverbial lion may assert himself just at the time when he will be least welcome.

From appearances there will be an abundance of stock appropriate for Easter, both plants and cut flowers in quantity enough to supply the demand no matter how heavy. The warm sunny weather has hastened the plants along and those who feared that they might get left on account of the earliness of the date are now assured of having a full supply ready. Ten dollars per hundred on plant or cut is the average price asked in advance by the lily growers.

Violets continue very plenty. There are many more than the market under ordinary conditions can consume. One cannot avoid wondering why some growers persist in growing the white violets for the market. They are and always have been dead stock, lacking entirely the popularity which the purple violet possesses and being salable only on rare special occasions. Like the orange flower they are useful for the local florist to grow in small quantities that he may have them

on hand when occasion requires, but as a crop for the wholesale market nothing could be much more unsatisfactory than the white violet.

Late cypripediums, that is those held on the plants until the present time, also give unpalatable results. They are soft and do not last any time after being brought in. It would have been better to have sold them two months ago even at the lowest figure, for nobody wants them in their present condition. Tulips of the light pink shades both double and single sell fairly well, but these are the only desirable colors and the prices prevailing do not furnish much profit when the first cost of the bulbs and the expenses and loss of forcing are counted.

Persistent efforts to drive the Greeks off the street are still being indulged in by some of the retail florists. Naturally the wholesale dealers do not sympathize with the movement, for were it not for the Greeks it is difficult to imagine what would become of the surplus stock of flowers, in spring time especially. It is doubtful however whether in case these people were removed from the streets the result would benefit the retail florists any as the offensive element would soon find stores and so become more formidable as competitors than they can ever become in the street.

Ernst Asmus made a speech at the Florists' Club meeting which is worthy of record. On being installed as vice-president he responded to repeated calls as follows: "Gentlemen, I think it something unusual to ask a vice-president for a speech. I haven't prepared any, so you won't get any. That's all there is about it."

It is surprising to note how generally the rose growers and carnation growers, especially the latter, are using Mr. Joosten's Fostite for the prevention of insect and fungus pests. A batch of rooted cuttings, nowadays, without a thick sprinkling of this useful powder is a rarity.

Thos. L. Russell, the well-known "Peripatetic" of the *Florists' Exchange* died suddenly on Broadway on the afternoon of March 15. He has been a familiar participant in the Florist Club meetings and other gatherings of the craft in and about New York for the past three years and made many friends. His funeral took place at Brooklyn on Sunday, 18th inst.

The plant auction business was opened in due form for the spring season by August Rolker at his Greenwich street store. The stock consisted of hardy roses, azaleas, and other dormant stuff from Hulsebosch Bros. and others and went for fair prices.

Charlie Schnell, who has been in the employ of Burns & Raynor ever since they began business, has started on his own hook in the retail business at 514 Columbus avenue.

The young men in the store of Thos. Young, Jr. are very enthusiastic over a baseball club which they have organized and propose to give an opportunity to those who wish to cross bats with them at Atlantic City next August.

Robt. B. Young is again quite sick at his home in Brooklyn.

Chicago.

It has been an open secret for some time that the Governor of Illinois had, at the request of a disreputable gang of political heelers in this city, been bringing strong pressure to bear upon the Commissioners of Lincoln Park to force them to displace Superintendent Pettigrew and appoint in his stead a politician who would make a political machine of the force of men employed at the park. It so happened that the Commissioners were men of honor and high standing in the community who would not accede to such a disgraceful demand. They knew Mr. Pettigrew's ability, and they honored him for employing men on their merits and not on the recommendation of pot house politicians. But the governor, who seems of late to have been bereft of reason as well as common sense, has now called for the resignations of three of the commissioners who have resisted his demands, two of whom were his own appointees and belonged to his own political party. He will of course appoint in their places men who will act as puppets in his hands and as soon as the new board is organized the best superintendent Lincoln Park has ever had, and one of the ablest men in such work in this country, will be ousted from a position he has filled with the greatest credit. But the governor's act brought out such a storm of criticism that even he may pause in dismay. It is to the credit of the daily press of this city that every paper, regardless of political bias, poured broadside after broadside of bitter criticism at the governor and the miserable gang back of him. And papers of his own political faith were the most severe in their denunciations. The question is really not political but the issue has been drawn between the reputable and disreputable elements in each of the political parties. The governor cannot be reached as his term runs two years longer, but the man who has been at the bottom of the matter, one H. C. Bartling, has managed to secure the nomination of assessor for North Chicago, from one of the great political parties. He is a dangerous man who will apparently stop at no means to accomplish his purposes. He should be snowed under so deep at the coming election that even he will understand that his methods are repudiated by all decent people.

The market last week was unusually active. The weather has been as bright and warm as is rarely seen in March, and certainly must have aided largely in the production of flowers. But nevertheless stock in some lines was exceedingly scarce, particularly towards the last of the week, a state of affairs certainly gratifying and considering the fact that we are still in Lent it seems all the more remarkable.

There are probably two causes to which may be attributed the scarcity of roses. One is the fact that the plants in a number of the leading establishments are off crop; another is the increased demand on account of the Opera which opened the season last week. So far as is apparent now there will be a rather light cut of roses for Easter for the same reason. But appearances are often deceptive and the shipments from outside points may upset all calculations.

Although no advance in prices for the past week can be noted yet stock ruled firm in most classes at regular quotation figures, and few job lots, unless decidedly "off," could be bought at bargain counters.

Easter prices will take effect March 21. Quotations made by the wholesale men seem reasonable and as a whole lower than in former seasons. Beauties and Hybrids are quoted at 20 to 25, Jacques 18 to 20, Meteors 8 to 10, Mermets, Brides and La France 6 to 7, Niphetos and Gontiers 4 to 5, Perles 5 to 6, carnations long 1.50 to 2, fancy 2.50 to 3, violets 75 to 1.00, Harrisii 8 to 10, callas 6 to 8, Romans and narcissus 2 to 3, valley and tulips 3 to 4, daffs 3, Dutch hyacinths 4 to 6.

As will be seen by the above quotations Harrisii and callas are listed at much lower figures than were ever before made at Easter. It is apparent that commission men still have a lively recollection of the last Easter season when the mistake was made of demanding such high figures that most dealers held off in placing orders ahead. In consequence, as we all recollect, the market went all to smash on Easter Eve, and lilies sold for next to nothing.

OBITUARY.

ROBERT J. HALLIDAY.

Mr. Robt. J. Halliday, the well known florist of Baltimore, Md., died at 8:55 p. m. Sunday, Mar. 11, of catarrh of the stomach, at his home on the Liberty road near the city. His family, with the exception of his son William, who was attending college, were at his bedside, with his life-long friend, Mr. Wm. Fraser.

Mr. Halliday was born in Baltimore on March 4, 1840. His father, Robert Halliday, was a native of Dumfries, Scotland, and came to this country in 1837. Mr. Halliday received a good grammar school education, and at the age of fourteen he started to learn the business under his father, who took him into partnership upon attaining his majority, and he took charge of the large greenhouses then standing at the corner of Pennsylvania avenue and Dolphin street. Under his efficient management the business soon became the largest south of Philadelphia and plants and seeds were shipped all over the country.

His first store was at No. 1½ N. Charles street, which he took in 1870, from which he moved into the corner store in a few years, then into the large building at 10 W. Baltimore street in 1883. After his two eldest sons, Robert and John D., started in the cut flower business for themselves, he moved to 8 S. Charles, and finally in 1892 to the store now occupied, No. 111 N. Charles street.

He was an enthusiast on camellia culture and in 1880 wrote a most valuable compendium of his experience in propagating and cultivating the plant, which was followed in 1882 by an equally thorough and interesting work on the azalea. Personal friends of Mr. Halliday can obtain these works gratis as souvenirs by applying to Messrs. Halliday Bros., 11 E. Baltimore street.

The business at 111 N. Charles will be carried on by his heirs until April 10 next in order to straighten out all matters connected with it.

Mr. Halliday was married three times, first to Miss Christine Dick of Philadelphia in 1863, then to Miss Emma Stewart of the same city in 1875, and last to Miss Mary Stewart, sister of his second wife. He leaves three sons, Robert, aged 29, and John Dick, aged 26, children of his first wife, and William, aged 17, child of his second wife.

Mr. Halliday was a man whom to know intimately was to like. His unfailing kindliness and generosity were the secret of his attractiveness, and his host of friends can testify to the disinterested way in which he ever placed himself at the disposal of anyone seeking his advice or assistance. A true, generous, kindly, whole-hearted Christian gentleman, he lent a dignity and grace to his business. He raised it to a position of importance which it had never before attained here, and in his intercourse with visiting flo-

THE LATE ROBERT J. HALLIDAY.

rists from other cities he showed them the hospitality of our southern life with a geniality and heartiness unrivalled.

Mr. Halliday was a prominent member of the Westminster Presbyterian Church. He was the president of the Gardeners' Club for the first three years of its existence, and but for his courage, patience and generosity it may be doubted whether we would to-day have a horticultural organization of any kind. All who knew him were attached to him, and all will miss him and his influence.

Buffalo.

A view of the stores on the Monday preceding Easter gives one but a poor idea of the gorgeous display that is promised for the end of the week. In addition to the regular stores on Main street there will be a few others doing business for one week's standing. J. Stafflinger has secured the use of a vacant store on Main near Swan street. Mr. Christenson has rented a window of one of our most popular grocers and will doubtless make a big display, as he has the stuff to do it with.

Mr. J. H. Rebstock is rushing the work on his new store and says he will be in there by Thursday. Joseph has just returned from New York where he went to visit some of the big growers and pick up novelties. I could not hear that he saw any novelties and found prices for good plants away up in G. He speaks of the cytisus and azaleas at James Dean's as the finest he ever saw. Mr. Anderson is off for New York and W. J. Palmer, Jr. leaves to-night for the same point, both no doubt to gather in some fine things for Easter. Mr. Anderson says he is going to make a specialty of hybrids and violets.

Palmer's is looking very gay with an enormous quantity of daffs of the finest quality. They are making preparations for a big plant trade. Their large store affords a good opportunity for this line of business. Mr. Stewart will have a large lot of Canadian roses to offer. He is fortunate to have them for they sell on sight. Adams & Nolan are preparing for a big trade. They say carnations will be their specialty. A look in at Scott's store—where old man Mepsted presides—showed us a fine lot of plants of almost all the popular kinds; particularly were his azaleas fine. Mr. M. expressed it as his opinion that stock of all kinds would be none too plentiful and every thing would be bought up close. Mr. Constantine, of Niagara street, is laying in a large supply of plants and thinks nothing will be in too great an abundance except perhaps callas, of which he as well as others in this locality have had great quantities this season. Mr. George Hale under the Genesee Hotel has a very attractive window; he always carries a fine line of carnations, Buttercup being the leading card. He anticipates a good demand both in plants and flowers.

The question being put to each florist, "What are you making a specialty of?" The answer was in nearly every case, "Carnations if I can get enough." This shows how popular we all find this beautiful and inexpensive flower. The millions will ask for carnations while the few ask for roses.

The weather is the all important question. If fine and not windy what a blessing, but if next Saturday assumes a typical March style, cold and breezy, oh my! it will add many grey hairs to some of us who are already bald and white.

Last Tuesday our club elected its new officers and they are as follows: President, W. A. Adams; vice-president, J. W. Constantine; recording secretary, Wm. Scott; financial secretary, Henry Millatt; treasurer, Edward I. Mepsted. After the election we had—well you could not call it a banquet but it was better than that—a most pleasant time. Everybody was called on for a speech and in every case acquitted themselves finely. Of a higher order than is usual on such occasions were the remarks of Wm. McMillan, J. W. Constantine and Prof. Cowell, but they were all good and those who were foolish enough to stop at home or seek more frivolous amusements missed a great treat.

W. S.

St. Louis.

The trade for the past week remained fair. The weather continues warm and springlike, and as a result the plant shipping trade has commenced to boom, all hands being required to keep ahead of the orders. Judging from the way it has opened, the prospects may be said to be brighter for a good shipping season than at any time this year.

Easter stock is in good shape, there being plenty of it on hand at all the growers; if anything it is a trifle early, owing to the unprecedently favorable weather, and the prospects are that the demand for it will be fully up to expectations. But flowers are also in good supply, and can undoubtedly be had in sufficient quantities to satisfy buyers. The fact that there will be an increasing demand is proven by several heavy orders that have been placed.

The Jordan Floral Co. have commenced cutting from one of their Jack houses, and during the week have shown some elegant flowers; they will keep it up through Easter time, and on into the spring.

The refreshments provided by the Bowling Club for the working members at the last two meetings have proved such a good thing that the members are more than ever satisfied with the Club.

R. F. T.

Correction.

In Mr. Robinson's essay on progress in orchid culture in our last issue a typographical error in the third paragraph, second column on page 726 made him say "Mrs. Ames' collection (of masdevallias) to-day comprises more than one hundred varieties exclusive of our own *houses*," when it should have read "exclusive of our own *hybrids*."

SOME DAYBREAK CARNATIONS recently sent by Mrs. J. D. Knox, Butte, Montana, arrived in excellent condition, and were of good quality. Evidently Montana intends to keep up with the floral procession.

THE UNIVERSAL EXPOSITION of Lyons, France, calls attention, by a notice recently received, to the competition in the horticultural section, which will extend through the entire season, beginning May 1. Intending exhibitors are requested to address Exposition Universelle, Lyons, France.

THE PENNA. HORTICULTURAL SOCIETY has issued the premium list for their chrysanthemum show, which opens Nov. 6 next, continuing four days. Among the plant prizes is $100 for collection of 10 plants, 10 varieties, $25 for collection of new varieties, not disseminated prior to 1894, and $10 for best specimen plant, new variety. There are seven special prizes of $25 each, two of $50, and two silver cups, in addition to the usual list for roses, carnations, plants, designs and decorations.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

SITUATION WANTED—As all round florist; growing roses, carnations, general stock, ferns, palms, etc.; 15 years' experience. R S, care Am. Florist.

SITUATION WANTED—By first-class rose grower, Pacific coast preferred; references; also from present employer. Box 125, care American Florist.

SITUATION WANTED—By a young man 26, as greenhouse assistant, 4 years experience; good references as to character and reliability. Address ERNEST, Louisville, Ky.

SITUATION WANTED—By a young woman in florist's establishment, has some experience in making up and arranging flowers. Address FLORAL, care M. J. Lynch, Poughkeepsie, N. Y.

SITUATION WANTED—By a young single German, 8 years' experience; either in cut flowers or catalogue trade. Good references on hand. Address H B, care American Florist, Chicago.

SITUATION WANTED—As gardener and florist in private place; French; 8 years in this country, steady, sober and honest. Good references. FLORIST, box 134, Bay Side, L. I., N. Y.

SITUATION WANTED—By a good all round florist, as assistant or foreman, successful grower of plants and cut flowers; good recommendation. Address ROSE, care American Florist.

SITUATION WANTED—By good grower of roses, carnations, violets, etc., as working foreman; 14 years experience, age 30, married; best of references. Address K G, care American Florist.

SITUATION WANTED—By Dane, to work in greenhouses. Best references from Denmark and this country. New York or New Jersey preferred. Address NISSEN, 230 Division St., New York City.

SITUATION WANTED—Gardener, single man having 13 years' experience, well posted in growing orchids, ferns, palms, etc. Private or commercial. Address A D, Penn St., Frankford, Philadelphia.

SITUATION WANTED—By first-class gardener, to take charge of private place in or near Chicago; will be open for engagement by April 1st. Best references from present employer furnished. Address C W, care American Florist.

SITUATION WANTED—By practical grower of roses, carnations and general stock, life experience in all branches, single, age 27, sober and steady; good recommendations; state wages. Address ALBA, care American Florist.

SITUATION WANTED—As manager, foreman, or headgardener in commercial or private place; German; thoroughly experienced in florist and horticulture; honest, sober and good worker. Good references. R H, care American Florist

SITUATION WANTED—By a successful grower of cut flowers and plants, 15 years practical experience in all branches, intelligent, honest, strictly sober, single, age 27, 2 wks; good recommendation; state wages. Address FLORIST, Box 625, Batavia, Ill.

SITUATION WANTED—By an energetic, first class single man, as foreman; thorough experience in all branches. Specialist in rose and cut flower growing. Best references. Ready for engagement at any time desired till July 1st. Please address AM. BEAUTY, care American Florist.

SITUATION WANTED—By April, in good private or commercial place, by competent German gardener and florist, single, middle aged, understands all kinds of outside and greenhouse work, including propagating and forcing. Address H. SCHARF, 625 Clybourn Avenue, Chicago, Ill.

SITUATION WANTED—By a German, competent first class florist, single, 35 years old, over 20 years experience, 10 years in U. S., asks a good and steady place as foreman in a commercial place, no private, to grow successfully florist stock; best of references. Address G. A. CLARK, Station M. N. E., Washington, D. C.

WANTED—A No. 1 rose grower, write stating terms with references. J. care J. C. Vaughan, Chicago.

WANTED—Gardener, single who understands raising vegetables for market; give references, state wages. MRS. T. STEARMAN, Mt. Vernon, O.

WANTED—A single German gardener for vegetable and flower garden work, good wages and board. Address UPPER PENINSULA BREWING CO., Marquette, Mich.

WANTED—An assistant well up in greenhouse work; some experience in bedding out; state wages expected with board. JOHN RECK, Bridgeport, Conn.

WANTED TO RENT—A place, from 8,000 to 10,000 feet of glass, with or without stock, hot water heating preferred. Address C W, care Greenhouses, 4th Ave. and 17th St., Minneapolis, Minn.

WANTED—A first-class working foreman to take charge of 20,000 feet of glass, and grow roses, carnations and general stock. Applicants please forward references, and state wages expected. W. L. MORRIS, Des Moines, Iowa.

WANTED—An orchid, palm, fern and stove plant grower; one who is sober, well up in the business, and will attend to his own department, and not in any way interfere with men in other departments. I want a reliable man—none other need apply. R. J. MENDENHALL, Minneapolis, Minn.

WANTED—A PARTNER—To join me growing and selling native and foreign hardy ornamentals, to meet the wants of American and foreign customers. Trade already well established and growing. A Christian and a prohibitionist preferred. Must be competent for the business, and free from bad habits. Some capital needed. Guaranteed a first-class opening for the right man. WILFRED A. BROTHERTON, Rochester, Mich.

WANTED—Before June 1st, thoroughly competent man, as foreman in a large establishment; must thoroughly understand the growing for cut flowers of roses, carnations and chrysanthemums, also bedding plants and ordinary nursery stock. To the right man a good position at good wages is offered with the chance of future advancement. None but first-class men need apply. Correspondence solicited. Address ROSE GROWER, care Box 47, Mt. Vernon, N. Y.

FOR SALE OR TO LET—A valuable florist business. For particulars address JACOB MENDEL, Lock Box 59, Nyack, N. Y.

FOR SALE—One Kroeschell hot water boiler 4x12; 4 years in use. Also about 4000 feet 4-inch pipe. ART FLORAL CO., 3911 Cottage Grove Ave., Chicago

FOR SALE OR RENT—Greenhouse located at end of the Chicago Lake Shore Electric R. R., Evanston, Ill. Address W. J. DOWNES, Evanston, Ill.

FOR SALE—Four greenhouses, well stocked, with very valuable piece of ground, reason for selling old age. Address WM. SPRINGBORN, Dubuque, Ia.

FOR SALE—A well established seed and hardware business near Chicago, doing a gardener's and local trade of about $20,000 per year. Cause ill health. Address M. HERMES, Havelock, Ill.

FOR SALE—Desiring to move at once on account of ill health of wife will sell at a sacrifice an establishment and paying florist business well worth $3,000. Address CENTRAL, care American Florist.

FOR SALE—Three greenhouses, with stock, etc., heated by steam, situated in a growing town in Central Ohio, with population of 18,000; business established in 1889; no other florist in town. Price low to quick buyer. Address P J, care American Florist.

UNIONTOWN, PA., March 19, 1894.

Notice is hereby given that the partnership lately subsisting between Henry Hughes and Charles E. Stenson, of Uniontown, Pa., under the firm name of Hughes & Stenson, Florists, was dissolved on the 13th day of March, 1894, by mutual consent. All debts owing to the said partnership are to be received by the said Henry Hughes, and all demands on the said partnership are to be settled and paid by him. The said business will be continued at the same places as heretofore by said Hughes. HENRY HUGHES. CHARLES E. STENSON.

WANTED

A few plants of Water Snowflake. Address with price, VAUGHAN'S SEED STORE, 146 and 148 W. Washington St., Chicago.

FOR LEASE.

The greenhouse property in Westwood, near Cincinnati, now occupied and running very successfully by J. Peterson, consisting of greenhouses 120x120 feet, a 5-room dwelling, and three or more acres of land; will be for lease on June 1st, 1894. Favorable arrangement can be made with present occupant for part of the stock if desired. Address, with reference, JOHN M. MILLER, Westwood, O.

REINBERG BROS.

Wholesale Florists and Growers,

PHONE MAIN, 4937. 51 Wabash Avenue, CHICAGO.

Our Great Specialty:

THE AMERICAN BEAUTY.

We had to refuse hundreds of orders this season for American Beauties; this has encouraged us to such an extent that we have arranged to grow more than double the amount next season. We invite all customers who want Beauties next season to remember that we have them.

Don't forget that we have a large supply of fine Roses and Carnations. We shall grow in addition to our large assortment of Roses, Bridesmaid, Testout, Kaiserin and Meteor. We are prepared to fill your orders with first-class Flowers of all the leading varieties of Roses, Carnations, Violets and miscellaneous Flowers. Give us a trial order.

WE ARE NOW OFFERING ROOTED CUTTINGS OF ROSES AND CARNATIONS. SEE AD. ELSEWHERE FOR PRICES.

FLOWER SEEDS.

We have a complete stock of fresh and reliable Flower Seeds on hand, of a quality that cannot be excelled, and at prices that will compare favorably with those of other reliable houses.

We will allow a special discount of 10 per cent on all Flower Seed orders, mailed to us before April 1st, if you mention having seen our ad. in the spring issue of the American Florist.

Decision About Duty on Plants.

ROSE PLANTS, GLADIOLI, AND PINKS.

Before the U. S. General Appraisers at New York, January 23, 1894.

In the matter of the protest 21874 *b*-2. of J. M. Bonnott, against the decision of the collector of customs at Norfolk, Va., as to the rate and amount of duties chargeable on certain gladioli and pinks, imported per *Moravia*, January 15, 1894.

Opinion by LUNT. *General Appraiser.*

We find—

(1) That Mr. J. M. Bonnott imported into the port of Norfolk, January 15, 1894, certain merchandise which was assessed for duty as nursery stock at 20 per cent ad valorem under paragraph 282, N. T., and which is claimed to be free under paragraph 666.

(2) That the merchandise consists of rose plants or bushes, gladioli, and pinks.

(3) That the roses and pinks are chiefly used in the United States for forcing under glass for cut flowers, and the gladioli are not, but are bulbous roots not edible.

Inasmuch as the importer has not claimed the gladioli to be free under the paragraph applicable thereto, his claim as to the same is overruled, but we hold the roses and pinks to be entitled to free entry under the paragraph specified, and sustain the protest as to these items.

Asparagus Plumosus Turning Yellow.

I would like to inquire the cause and remedy of the turning yellow of foliage of Asparagus plumosus. A. R. SMITH.

LITTLETON, N. H.

We referred your inquiry to Mr. W. H. Elliott of Brighton, Mass., who answers: "It probably turns yellow from the soil being too heavy and wet. The remedy would be to give it a light soil and less water."

Always mention the American Florist when writing to advertisers.

CYCLAMEM. GIGANTEUM. Now is the right time to sow CYCLAMEN SEEDS to have them flower next winter. I have a choice strain imported from a celebrated English specialist. All colors mixed, large and very rich. $9.00 per 1,000 Seeds. 1.00 per 100 Seeds. G. C. WATSON, 1025 Arch St. Phila., Pa.

WHITE GLADIOLI. SUPERB XX MIXTURE Also Begonias, Lilies, Gloxinias, Irises, Cannas, and many other rare and beautiful summer-flowering Bulbs. Start them now. Price List free. Prices right.

for Florists (containing 10 per cent of the new Snow White), $3.50 per 100.

MUSHROOMS. Most delicious of all esculents. "The Why, When, Where and How of Mushroom Culture." 24 pp., 10c. "W. P." Brand MUSHROOM SPAWN. Always reliable. Fresh and Well-Spawned. Send for price list.

PERUVIAN GUANO. Genuine "Lobos" from So. America. Indispensable to Gardeners who desire the highest perfection in bloom. Direct importation from So. America now to hand. Note the price, only $3.25 per 100 lb (bags average 228 lb each). No less than 1 bag sold. 10 per cent off in 5-bag lots.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer, 114 Chambers street, New York. Next annual meeting second Tuesday in June, at Toronto, Ont.

Notes.

At Detroit the seed trade complain of poor business during the last of February, but state that the first third of March more than makes up the difference. The local trade are indulging in some competition for the market garden business.

At Indianapolis the dealers are rushed. They claim trade more than double last year up to date and appearances bear out their claim.

At Cincinnati trade was fully up to last year in the retail business and considerably ahead in bulk department. Plenty of onion sets in the hands of farmers, but dealers short and buying only when needed.

At Rochester the trade was never so good before. Stock is becoming rapidly depleted and anxiety expressed as to where they can be renewed. Commission concerns are closing their northern shipments and working into the night to do it. Last season's commission sales were the best ever known. Briggs Bros. & Co. have opened a fine retail store next to Crosman Bros. on Clinton St., making quite a seed center there, as Vick's retail store is around the corner on Main St. Mr. Chas. Crosman's family are leaving for Aiken, N. C., for a two months stay at the noted sanitarium there.

F. T. E.

ROCHESTER, N. Y., March 14.

Recent Import Decisions.

GRASS SEED—CLOVER.

Before the U. S. General Appraisers at New York, January 29, 1894.

In the matter of the protest, 53977 *a*-11569, of Henry Nungesser, against the decision of the collector of customs at New York as to the rate and amount of duties chargeable on certain seeds, imported per Berlin, June 6, 1893.

Opinion by SOMERVILLE, *General Appraiser*.

The goods are invoiced and entered as 100 bags of clover seed, and were assessed for duty at 20 per cent ad valorem under paragraph 286 of the new tariff act of 1890, as "agricultural seeds" not specially provided for in said act. They are claimed to be free of duty as "grass seeds" under paragraph 699 of said act, which exempts from duty a large variety of seed, including "all flower and grass seeds," not specially provided for in said tariff act.

We have held in a recent decision (*In re* Henderson & Co., protest 56550 *a*, not yet published) that "grass seeds" are a species of the more generic descriptive term "agricultural seeds," and for that reason a grass seed, although sown in fields, as distinguished from use for ornamental purposes in lawns or otherwise, is subject to classification under paragraph 286, and not under paragraph 699, unless more specifically provided elsewhere in the tariff act.

Clover is a species of grass, and is so considered commercially as well as in common parlance. It is defined by Worcester to be "a valuable kind of grass of several varieties." It is so characterized in McCullough's Dictionary of Commerce (p. 302, Ed. 1882): "A very important species of grass."

61 ANN STREET, NEW YORK.

[SEED TRADE.—CONTINUED.]

The word grass, it is true, formerly meant any green herbaceous plant of small size; but in modern and especially botanical nomenclature the term is more narrowly confined to plants belonging to the order of *Gramineæ* (or *Graminaceæ*).

The testimony in this case shows that clover seeds are known commercially as grass seed, and are dealt with in trade under this designation. The same fact has been made to appear by satisfactory evidence in other cases before this board where similar questions were under investigation.

We find as facts from the evidence—

(1) That the article covered by the protest is the seed of the crimson clover, known as scarlet clover (botanical name, *Trifolium incarnatum*), which belongs to the red clover family.

(2) It is commercially known as a grass seed, and sown chiefly, if not alone, for the forage of hay crop produced from it.

The protest claiming the article to be free of duty as a grass seed under paragraph 699 is sustained, and the collector's decision is reversed, with instructions to reliquidate the entry accordingly.

GRASS SEED—ITALIAN AND ENGLISH RYE GRASS.

Before the U. S. General Appraisers at New York. January 29, 1894.

In the matter of the protests, 56550 *a*-13633 and 56999 *a*-14998, of Peter Henderson & Co., against the decision of the collector of customs at New York as to the rate and amount of duties chargeable on certain seeds, imported per Bourgogne, July 31, 1893, Circassia, August 9, 1893, and Champagne, August 9, 1893.

Opinion by SOMERVILLE, *General Appraiser*.

The board, having taken at the hearing of these protests the testimony of many dealers in seeds of all kind, make the following findings of fact, based on the record and other evidence:

(1) The merchandise covered by the first-named protest (No. 56550 *a*) is invoiced as "10 bales of grass seed," and was returned by the local appraiser as "grass seed or agricultural seed."

(2) It is in fact Italian rye-grass seed, and is so known in trade, the botanical name being *Lolium Italicum*.

(3) The use of this species of grass is for hay and pasture only.

(4) The merchandise covered by the second protest (No. 56999 *a*) is invoiced as "30 bales extra Ayreshire perennial rye grass," and was returned by the local appraiser as "grass seed for agricultural purposes." This article is commonly and commercially known as English rye-grass seed (botanical name, *Lolium perenne*).

(5) The rye grass raised from the seed is used chiefly for hay and pasturage, but, being perennial, also to a limited extent for lawns and meadows, being mixed for this purpose with other lawn grasses.

(6) Both of the foregoing articles are agricultural seeds, being commonly used in fields and on farms for the uses above stated.

(7) Each of them is known as grass seed, both in common parlance and among importers and other dealers in the seed trade.

The collector assessed both the English rye-grass and the Italian rye-grass seed under paragraph 286 of the new tariff act, which reads as follows:

Garden seeds, agricultural seeds, and other seeds not specially provided for in this act, twenty per cent ad valorem.

W. B. WOODRUFF, Florist, Westfie J.

[SEED TRADE.—CONTINUED.]

The importers claim that they should each be exempt from duty under paragraph 699, which places on the free list a great variety of seeds, including "all flower and grass seeds" not specially provided for in said tariff act.

The question raised by the protests is, which is the more specific and minute descriptive term, agricultural seed or grass seed.

The history of legislation on this general subject and the rulings of the Treasury Department under laws prior to the present tariff act (1890) are reviewed by Justice Blatchford in Ferry *v.* Livingston, (115 U. S., 115.) That decision seems to recognize the principle that the phrases "garden seeds" and "agricultural seeds" are descriptive merely, indicating rather the uses made of such seeds than the commercial designation of the articles, and the view is expressed by the court that the general and not the exceptional use must determine the classification. This view was followed in Clay *v.* Magone. (40 Fed. Rep., 230.)

The evidence in this case fully sustains the fact that the words "agricultural seeds" in the trade are understood generally to mean such seeds as are sown in fields, as distinguished from those sown in gardens and used for ornamental purposes in lawns.

The evidence further shows that those grass seeds which are chiefly used for sowing or are grown in fields are generally regarded by the trade as a species or subdivision of the more generic term "agricultural seeds." The commercial seed catalogues introduced in evidence on the hearing corroborate the same fact.

Both varieties are catalogued under the head of "grasses," which are distinguished from "farm seeds" usually sown in fields, such as turnips, corn, buckwheat, oats; rye, wheat, barley, and the like.

We extract the following definitions from the testimony of Mr. Burnet Landreth of the firm of D. Landreth & Sons, said to be the largest seed producers in the United States, which was given at a hearing before the Committee of Ways and Means (Fifty-first Congress, January, 1889, p. 876, Revision of the Tariff):

Garden seeds are seeds of plants producing edible tissue without process of machine manufacture.

Agricultural seeds are seeds of plants either not edible, as grass seeds, or such as require manufacture, as wheat.

This latter definition supports the testimony of the witnesses given before this board in the present hearing, that "grass seeds" are regarded as a species of the genus "agricultural seeds."

We hold, accordingly, that the phrase "all * * * grass seeds" in said paragraph 699 of the free list, is more specific than the words "agricultural seeds" in paragraph 286, and that the former phrase includes Italian rye grass and English rye grass of the varieties above described.

The contrary view announced *In re* Central Vermont R. R. Co. (G. A. 2161) is modified accordingly.

The protests are both sustained (the one in 56999 *a* being confined to the article of rye grass per steamer Circassia). The collector's decision is reversed as to the above articles, and affirmed as to all others on the invoices, if any, covered by said protest.

NEW YORK.—Spring orders are piling up in a most gratifying manner and everybody is behind-hand in the rush. The stock of several popular varieties of flower seeds is already exhausted. Messrs. E. B. and A. N. Clark of Milford, Conn., and J. Green of Waterloo, Nebraska, have been visiting New York the past week.

New Chrysanthemums for 1894.

SIXTEEN OF THE VERY BEST OF THE YEAR.

A. H. Fewkes, Achilles, Challenge, Eugene Dailledouze, Minerva. Yellow Queen, Iora, Laredo, Lady Playfair, Maj. Bonnaffon, Marie Louise, Mutual Friend, Mrs. J. Geo. Ils, Mrs. E. G. Hill, Prairie Rose and Pitcher & Manda. One plant each $7.00.

GOLDEN HAIR.—The most remarkable of all the Ostrich Plume section, color yellow shaded amber, petals broad and of great substance. $1 25 each; $10 00 per doz.

We have a large stock of healthy, well established plants of those varieties most suitable for Florists' use, such as:

WHITE.	YELLOW.	PINK.
Ivory.	W. H. Lincoln.	Eda Prass.
Mlle. Therese Rey.	Emma Hitzeroth.	Ermenilda.
Mrs. Robt. Craig.	H. Cannell.	Viviand Morel.
Miss Jerome Jones.	Golden Wedding.	Harry Balsley.
Niveus.	Harry E. Widener.	John H. Taylor.
The Queen.	Col. W. B. Smith.	Pres. W. R. Smith.

The foregoing and fifty other choice varieties at reasonable prices.

WE REPEAT THAT THE NEW FANCY CARNATION "HELEN KELLER"

Is the most beautiful in form and prolific in bloom of any carnation that has been brought to our notice up to the present time.

We will read to you a letter under date March 10. It is from the well known W. Raymond, Esq., proprietor of the **Raymond Flower and Seed Store,** Boston, Mass., and also of the **Raymond Nurseries,** Pasadena, California.

"The box of Carnation blooms that you sent to me at Cambridge (Mass), were duly received, and I find them so satisfactory, that I send herewith a check for $78.00, which with the $12 00 sent you recently will make $90 00, and you can change my recent order making it 1000 instead of 100. I thought that our carnations in California were as large as could be grown, but your 'HELEN KELLER' beats them all." All of which is is endorsed by those who have seen it **Growing** and **Blooming.**

Price for well rooted cuttings, $3.00 per doz.; $12.00 per 100; $25.00 for 250; $90.00 per 1000. 500 at 1000 rate.

ORDERS MAY BE SENT EITHER TO

J. N. MAY, SUMMIT, N. J. OR EDWIN LONSDALE, CHESTNUT HILL, PHILA.

Montreal.

At the last meeting of the G. and F. Club, which was well attended, it was decided to hold another chrysanthemum exhibition this coming fall, and the executive were instructed to get out an advance sheet at once. The annual social will take place on Thursday after Easter, and the usual drive will be dispensed with. The matter of affiliation with the Montreal Horticultural Society does not make much headway, and the idea seems distasteful to several members of the club. At the next meeting the advisability of applying to the legislature for a charter of incorporation will be considered. This subject has been mentioned before but no action was taken by the club. Several new members were nominated.

An able and exhaustive essay upon lilies, was read by Mr. Jules Betrix. The essayist took great trouble to procure all the information available concerning this class of plants, but he more especially pleaded the cause of L. auratum. In discussion the question of the cause of Harrisii splitting was asked, and the prevailing opinion was that it was owing to some check or injury received by the bulb early in the season. In regard to dwarfness of the plant Mr. McKenna had a plant which carried several flowers and was only 10 inches in height, while Mr. Bray by some good management had them only eight inches in height, which is certainly dwarf enough at any rate. Mr. McKenna also read an exhaustive paper upon carpet bedding plants, their propagation and culture. The president exhibited in 3-inch standard pots three cinerarias, which for uniformity of size, color and quality and quantity of bloom, were the admiration of all who saw them.

The weather, which has been mild and bright, has again changed and dull days succeeding, cut flowers for Easter trade will be none too plentiful; at any rate appearances point that way; crops of roses and carnations will hardly be in on time. Bulbous stock will be plentiful, also spiræas. Lilies are likely to be in rather short supply. Azaleas and rhododendrons will help to make a good showing.

Shamrocks were out in plenty for St. Patrick's day. Everybody grows them now a days up in this part of the world although by report some cannot realize much profit on them.

Bedding stuff is being more largely grown than before, although we sometimes hear that it scarcely pays for the trouble except in certain localities.

A recent visit to P. McKenna & Son showed as fine a house of carnations as could be wished for. They were throwing up immense quantities of flowers, but would scarcely be in for Easter. Mr. McKenna has a fine pink sport from President Cleveland bouvardia which he is watching with great care. If he succeeds in fixing it we may soon hear more about it.

Business is generally reported good for the season of the year. One of the largest private establishments in the city is to be removed as the land is needed for building purposes. The plant has been purchased by A. Martin who will remove it to his country nurseries at Broadlands at an early date, re-erecting in suitable style for growing florists' stock. HABITANT.

Please mention the American Florist every time you write any of the advertisers on this page.

Higher
prices have been paid this season in Boston for
Ada Byron and Nicholson
than for any other Carnations because they are the
Purchasing Public's Ideals.
Ada Byron is the deepest yet brightest pink imaginable,
Nicholson is just the color of a Mad. G. Luizet Rose.
Language cannot describe the sweet clove-fragrance they possess.
They are superior in vigor, size, color, fragrance,
keeping and selling qualities to any yet produced.

The Best Carnation in the Market.

THE ADELAIDE KRESKEN

Which was originated in 1891, and flowered in the same year, is conceded by all to be the prettiest Carnation ever grown. Strong grower, free from rust, 1½ ft. high, stiff stem, good calyx, and the flower (of a beautiful rosy pink color) averaging three inches and over.

A VERY FREE BLOOMER. In addition to recovering the **Best Seedling Prizes** at Cincinnati, O., Club Certificate at Springfield, Mass., and Milwaukee, Wis., Hunt Prizes, Indianapolis, Ind., it has received Certificates of Merit at the American Florists' Society, St. Louis, Mo.; also the best vase of pinks at St. Louis, Mo., and Certificate of Merit at Toronto. The undersigned begs leave to submit the following exceedingly low prices for **Rooted Cuttings**, which will be ready March 1st, 1894: **$2.00 per doz.: $10 per 100; $45 per 500; $80 per 1000.**

Cash must accompany all orders. Address all communications to

TESTIMONIALS.

SEAWANHAKA GREENHOUSES, W. L. Swan, Proprietor,
OYSTER BAY, L. I., January 25, 1894.

Last fall, to complete my stock for bench planting, I purchased of you a lot of carnations. It gives me pleasure to assure you that they were entirely satisfactory, and the *best* carnation plants I have ever purchased. It is a great blessing to Long Island florists to have near-by facilities for purchasing first-class stock, such as your establishment is affording, and I hope you will be liberally patronized as you so well deserve. Wishing you the fullest measure of prosperity, I remain, Respectfully yours, W. L. SWAN.

WILKESBARRE, PA., January 24, 1894.

The carnations procured from you last fall were the healthiest and cleanest stock I ever saw. They have done excellently well. As I required these for stock, health and vigor, of course, was the great desideratum. In these days of rust, bacteria, and all the ills which affect the carnation, it is a great pleasure to know where to procure stock free from these diseases. Yours very truly,
GEO. E. FANCOURT, Rose Grower.

TARRYTOWN-ON-HUDSON, January 25, 1894.

The carnations obtained from you last spring were obtained for sale and propagation purposes only. The plants were very satisfactory, being strong, healthy, well rooted cuttings, and we were very much pleased with them.
Very truly yours, F. R. PIERSON CO., Florists.

BUFFALO, N. Y., January, 1894.

I had from you last spring 500 Daybreak and 500 Wm. Scott carnations. I am glad to be able to say that the plants of both turned out remarkably fine, free from disease of all kinds. The bed of Wm. Scott has been loaded with buds and flowers from September 15th, and is finer to-day than ever and a sight that is good to dispel the blues. Respectfully yours, WM. SCOTT, Florist.

1623 DORCHESTER AVENUE,
DORCHESTER, MASS, January 26, 1894.

The carnations that I bought of you last season were healthy, well rooted, true to name, and full count. The most satisfactory lot I have ever received from a commercial house. Wishing you all prosperity at your new place and awaiting your list of novelties, I remain, Yours, etc., J. A. FOSTER, Florist.

BELLMORE, L. I., January 26, 1894.

The carnations purchased of you proved to be healthy and vigorous. They were very satisfactory. Your description of the merits of the new varieties was not overdrawn, thereby establishing our confidence in your stock for the future.
Yours respectfully, R. P. JEFFREY & SON, Nurserymen and Florists.

SEA-SIDE GREENHOUSES,
SOUTHAMPTON, N. Y., January 25, 1894.

Please send your price list of rooted cuttings as soon as issued. Those we received from you last season were first-class in every respect and have done well. We wish particularly to say a good word for Wm. Scott and Mad. Diaz Albertini. Both are very fine. Yours truly, HALSEY & EDWARDS.

Send for our Illustrated and Descriptive Catalogue, which gives in full our methods of growing and tells how we fight the rust.

THE COTTAGE GARDENS.

QUEENS, N. Y.

Montreal.

On the 26th of January, with the thermometer standing at zero, the writer with a couple of friends, seated behind one of Montreal's famous roadsters started for Dorval, the home of the "Montreal Forest and Stream Club," to make a long promised call on that prince of chrysanthemum growers, Mr. Thomas McHugh, the head gardener of the place. After a drive of nearly two hours we arrived there. Oh! what a lovely spot! It is situated on a little promontory extending out into the beautiful lake St. Louis and even with the ground hidden under two feet of snow it is worth going to see, with its abundance of specimen spruces, pines, etc., and arbor vitæ hedges. But it was not these we came to see. We came to see "Genial Tom" and his pets under glass. We expected to see something good, but on entering the conservatory we were truly surprised at the magnificent display of bloom which burst on our view. We might have expected it in March but such a display of bloom in January is seldom seen anywhere, and every plant a specimen. There were cyclamens in 6-inch pans (3 in. deep) with 100 buds and blooms; begonias 3 feet high with nothing but flowers from pot up; azaleas, in great variety and form perfect; pink geraniums fit for a September exhibition; Crozy Cannas in August splendor; a few cinerarias of immense proportions and great beauty of bloom; his calceolarias were not out but were promising to be grand; he showed us a variegated leaved Nicotiana affinis in good bloom. There were several specimens of cypripedium in grand bloom, one C. insigne bearing two flowers on each stem. A piece of wall was covered with Manettia bicolor, which was a mass of bloom; as specimen of Streptosolen Jamesonii 8 feet high was just coming into bloom; this was planted in its position from a thumb pot 8 months ago; a heliotrope about the same size was planted near it at the same time, also from a thumb pot; a few specimens of Genista canariensis were noticed in good bloom. There are no palms on the place, but their absence is not noticed, the house is so well filled with bloom. His display of foliage plants is confined to some beautiful crotons, dracænas, Araucaria excelsa, and adiantums. Altogether we come to the conclusion that Mr. McHugh's knowledge of plant growing is not confined to growing cup-winning chrysanthemums. After partaking of Tom's big-hearted hospitality we again tucked ourselves under the buffalo robes and turned our faces eastward and on our way home we called on Charley Smith, J. P. Dawes' gardener, at Lachine. We found his place looking well. His display of bloom was really meritorious, considering that he is under the disadvantage of having poor light, the buildings being old, but Charley seems to share the knack of growing cyclamens, as he has some very fine specimens. His Harrisii lilies were also fine. A few very fine specimens of palms and tree ferns were noted, also some very good crotons. Mr. Smith has also entered the ranks of chrysanthemum growers, he taking his share of the prize money last November.

The shades of evening were fast falling when we again resumed our journey homeward, which we reached about 7 o'clock after a very pleasant outing.

Mrs. W. C. Whitney.

Cross between American Beauty and Souvenir d'un Ami, combining all the best qualities of both parents without their defects.

The demand for this splendid variety has *exceeded* my *expectations* and I can only accept orders now to be filled from May 1st and onward. I have a good lot coming on for that date and hope to be able to fill all orders then.

All other stock of Roses in fine plants ready now.

NEW CHRYSANTHEMUM

Yellow Queen.

By far the very best early yellow yet introduced. Flower clear bright yellow with fine stiff stem and handsome foliage; in shape very similar to "Minnie Wanamaker."

Also Achilles, Malmaison, Mayflower, Minerva and Titian.

Five grand varieties either for exhibition or cut flowers.

All the leading New Carnations in fine healthy stock now ready.

For full particulars, prices, etc., see my price list, *mailed free.*

ADDRESS **E. B. JENNINGS,**
WHOLESALE PANSY GROWER,
Lock Box 254. SOUTHPORT, CONN.
Mention American Florist.

Philadelphia.

The cool weather of the early part of the past week was heartily welcomed by most of the growers. In many places the stock was coming on far too rapidly and if the warm weather had continued the results would have been disastrous; as it is, there will be considerable loss.

Spiræa compacta seems to be gaining ground and is likely to displace the old Japonica. Robert Craig had about 500 plants which were sold immediately. Everyone that saw it seemed to prefer this to the old variety. It requires more time than Japonica but when in full bloom it is a much more attractive plant.

Business the past week except Saturday has been extremely dull. There has been very little decorating and all around both from growers and dealers the report was "nothing doing." Of course this had a demoralizing effect on prices. It isn't the prices however that were affected so much as it was the quantity, or we should say the count. Brunners for instance are quoted at $5 per doz. by the growers. "Don't want any at that price," says the dealer. "Wait until I show you the dozen I'll give you" and the grower proceeding to count out, finally holding up from 20 to 24 fine specimens says, "how's that for a dozen?" and the dealer takes the chances. In smaller roses 25 of a kind generally count up to three dozen, etc. It was reported that one grower with a lot of boxes after going the rounds of the stores without success finally set them down on Chestnut St. and opening up was soon cleaned out at satisfactory prices by the passers by.

Quoted prices remain about the same as last week but will stiffen up a little for Easter except for lilies, which are offered very low. There promises to be a great lot of bulbous flowers in at this time, particularly of tulips, hyacinths and valley. There have been very few tulips about the past season and even these were hard to dispose of, nobody seems to want them. It would seem that the numerous Hollanders who are moving about with such activity at the present time will have a hard job securing orders, in the light of the grower's experiences of the past few years.

Growers are complaining of the daffodils; formerly they could get two flowers to a bulb and oftentimes three, but this year even two is an exception as very few bulbs produce more than one bloom.

GREENHOUSES: Western Springs. . . .

Tuberous Begonias
are THE flowers for table decorations and designing during the summer and autumn months.

Every Florist
should devote at least one house to begonias—it pays. Well grown they are a sight for many months, attracting crowds of visitors, who readily buy the beautiful pot plants or cut flowers. They advertise a place more than anything else, and after a season of sensation and profit leave the house clear for the regular fall and winter business. The tubers rest under the benches and occupy little space.

How To Do It.
Use our seedling plants, ready in May. They are entirely beyond the tender stages of the begonia—strong plants for three-inch pots.

PRICES: Doubles, $3.00 per hundred; $25.00 per thousand; 90 per cent will be double. Singles, $2.00 per hundred; $18.00 per thousand. These average 5 in. diameter. Success—To insure this, we give best instructions to the inexperienced, free.

J. HORACE McFARLAND, Harrisburg, Pa.

Boston.

The indications are that the supply of good stocky plants of longiflorum lilies will be none too large for the Easter demand in this city if the weather should be favorable for the buyers to get out. In fact all the desirable stock has already been placed by the growers and at prices far ahead of those prevailing in New York or Philadelphia. A number of temporary stores have been opened for the retailing of Easter plants and a very busy week is in prospect. Some well-informed do not hesitate to predict one of the best Easters on record (weather permitting). There is an abundance of fine azaleas and unusually well bloomed heath plants besides hydrangeas, genistas and other seasonable stock. On tulips, hyacinths and other bulbous stock in pots and pans Warren Ewell has the trade practically to himself as he is the only grower making a specialty of this class, but he will probably be able to supply all comers.

Cut flowers are in fair supply only. At no time has there been any very serious overstock. During the past week extra good carnations have sold readily at $2 to $4 per hundred and good Daybreaks have brought as high as $5. There are a few candidum lilies being sent in but this lily once so desirable for Easter purposes seems to have completely lost its popularity ever since the prices of Harrisii dropped so low. Violets are abundant and cheap. Astilbe Japonica is in market in quantity and among the novelties are English primroses, golden coreopsis, nasturtiums, etc.

J. J. H. Gregory of Marblehead delivered an interesting lecture on seed growing before the Massachusetts Horticultural Society on March 17. The usual attractive exhibition of cut flowers and plants was made by several exhibitors.

Mr. and Mrs. W. F. Dreer, of Philadelphia have been visiting Boston for a few days.

NEW TRADE PRICE LIST FOR SUMMER DELIVERY, 1894,

. . . IS NOW READY . . .

SEND FOR IT WITHOUT DELAY.

This list comprises all Goods which we can furnish between now and September.

Freesia Bulbs, (We will have ONE MILLION from 9-16 to ¾ of an inch), **Longiflorums,** (Equal and by many considered SUPERIOR to Harrisii), Superb Varieties of **Amaryllis, Eucharis Amazonica,** 4-7 inches.

CALIFORNIA BULBS.—The charming Brodiæas, Calochortus, Erythroniums, Fritillarias, which are gaining in favor every year.

TREE FERN STEMS.— Cyatheas, Dicksonias, Alsophilas.

PALM SEEDS from California and Australia. Kentias, Corypha, Arecas, Phoenix, Seaforthia, Macrozamia.

ORCHIDS from Central America. Cycas Revoluta Stems, Rhapis Palms.

SOMETHING NEW.

Clematis Gen. Grant, or Crimson Jackmanii.

STRICTLY AN AMERICAN SEEDLING, and possessed of qualities not common to foreign grown sorts, namely extreme woodiness and vigor, flowers in racemes of great size, substance, and depth of color; color a maroon crimson changing to a deep purple in the old flowers, and lasting a long time, in several cases over a week in good condition after being cut. This variety will be highly prized when known, on account of its peculiar lasting qualities, and being so well adapted to our hot suns and dry atmosphere—practical florists will understand this.

Price, good plants, $1.00 Each; $9.00 per Dozen. Very strong plants, home-grown, $1.50 Each; $15.00 per Dozen.

P. S.—Plants can be had of the undersigned, or of J. C. Vaughan, Chicago; or Phœnix Nursery Co., Bloomington, Ill.

CLEMATIS.

THE BROOKS SISTERS, Sorrento, Fla.

Baltimore.

The demand for flowers seems to increase in geometrical proportion daily. The death of Mr. Robert J. Halliday, causing the closing of four of our leading florists stores (his own, Halliday Bros., Wm. J. Halliday, and Mrs. M. J. Thomas) for several days, had some effect, in producing for the time being, an apparent though artificial rush of business in the other stores, to which the trade of these four was diverted temporarily. Then the death of a leading theatre proprietor, Mr. Jno. T. Ford, caused a demand for a big lot of roses, lilies, etc,, for though the papers stated "no flowers," the house was packed with magnificent pieces. Besides this spring is coming. Easter drawing nigh, and, with flowers plentiful and cheap, people are beginning to purchase more and more freely for the thousand little occasions which in every ones life occur so frequently.

Speaking of the funerals, probably never before in this city was as large a lot of flowers used at a funeral as at Mr. Halliday's, without one slight deviation from good taste in the entire collection. The decoration of the casket and the room in which it rested at the house, was as a whole beautiful in the extreme. A few choice plants were arranged back of the casket, which was covered with a pall of violets bordered with valley. The inside, as far as could be seen, seemed a couch of pansies upon which rested the dead florist, and the flowers that were placed about quite took away the cold, bare and depressing effect of so many death chambers.

Of the numerous floral tributes sent by friends, with two exceptions all were wreaths or simple clusters. The two exceptions were a standing crown sent by Mr. Wm. Fraser made of La France buds, with a base of lilies, and a large basket from the Gardeners' Club filled with the three favorite flowers of the deceased, azaleas, camellias, and genista. It would be hard to choose between the others, but a wreath of white hyacinths tied with lavender ribbon and a cluster of lavender hyacinths was fine, so was a wreath of violets and orchids, a cluster of roses and mignonette and a wreath of galax leaves and valley.

The officers of the club went to the house in carriages, most of the members each wearing a Perle bud, met the funeral at the cemetery gate and preceded it in procession to the grave. There they opened to the right and left and stood with uncovered heads while the casket and mourners passed through, then following passed by the open grave, each member dropping in the bud as he passed. The grave was lined with smilax and roses, the pile of clay at the side was hidden beneath a net of smilax, roses and violets, and if anything could alleviate the grief of his friends at their loss, it was the fitting way in which he whose life was passed among flowers was gently laid to rest among them at the last. MACK.

Toronto.

The weather being favorable the plant trade continues to boom in a mild way and retailers have a more cheerful tale to tell when one drops in to see them. Azaleas are now in full blast, but I hear that one florist has made a cut of from 50 to 75 cents, on $1.25 and $1.50 plants, which was altogether unnecessary and does nothing but injure the trade generally. It does not seem likely that the Easter prices of former years will be nearly reached, but it is possible that the volume of trade may be considerably larger in consequence. I notice a card up at one store to the effect that Easter orders will be booked now (15th) at present prices. "Things ain't what they use ter was"; it is a case of "sauve qui peut" and the devil take the hindermost now with some people.

Bermuda lilies are likely to be plentiful and the price is already cut down to a low notch. However putting things altogether there is likely to be a big lot of "stuff" handled in Toronto this Easter and good "stuff" too, but it is doubtful if those handling it will profit as much as they did in "the good old times" one reads about. I am not conservative enough to wish "the good old times" back again but I think the boys could make more money than they are doing if they would put their heads together.

Our New Scarlet Carnation

GENEVA

We will have ready for delivery April 1st.

This is undoubtedly the finest red yet introduced. In color it is a bright scarlet, strong grower with good long stems, does not break in the calyx, is fragrant, blooms from September to May, is not a cropper and **blooms fully as freely as Silver Spray.**

We are booking orders now for April 1st delivery, at $12.00 per 100.

We also have all the leading varieties, including Daybreak at $2.50 per 100, Edna Craig at $5.00 per 100, Wm. Scott at $5.00 per 100, Uncle John at $10.00 per 100, Silver Spray at $2.00 per 100, Lizzie McGowan at $2.00 per 100, Garfield at $1.50 per 100, Tidal Wave at $1.75 per 100, Portia, Hector and Lady Emma at $1.25 per 100.

YOUNG ROSE STOCK

Bridesmaid.

Young stock, fine and healthy, from healthy, cool grown stock, now ready at $6.00 per 100; $50.00 per 1000.

OUR NEW PLANT TUB.

PRICE LESS THAN HALF OF ANY OTHER TUB ON THE MARKET.....

Florists having large plants should not be without it.
Dealers issuing catalogues cannot afford to be without it.

IT SUPPLIES A LONG FELT WANT FOR SOMETHING

Neat, Durable and Cheap.

It has steel wire hoops (three times as strong as the flat iron hoop) with welded joints (not riveted as in common ware). These wire hoops are at intervals indented and pressed into the wood. These indentations in hoops, besides preventing them from falling under all circumstances, act also as a spring, expanding or contracting always in accord with the condition of the wood in the tub, so that bursting is impossible. **Write us for Prices.**

Cut Flowers. Florists' Supplies.

WE MAKE OUR OWN WIRE WORK. GIVE US A TRIAL.

Wisconsin Flower Exchange,

468 Milwaukee Street, - - - MILWAUKEE, WIS.

Palms. Latania Borbonica.

The best stock from 5 in. pots in the country, 5 to 7 good leaves, 24 to 28 in. high, $50 00 per hundred, $6.50 for sample dozen.

LATANIAS. From 2¾ in. pots, good stock for growing on, strong rooted and clean. $8.00 per hundred, $1.25 for sample dozen.

CROTONS. From 3 in. pots, 10 sorts, all good colors and varieties. $8.00 per hundred.

From 4 in. pots, 10 sorts, $15.00 per hundred.

Large plants from 5 and 6 in. pots, $4.00 per dozen.

Are a success as a plant for fine foliage beds, will stand the sun and hold their color better than anything in the way of Variegated Foliage, fully tested at Chicago, Washington and Philadelphia parks.

TUBEROSES. Extra double pearl, $12.00 per thousand.
" Fine " " 10.00 " "
" Good blooming bulbs, 7.50 " "

CATALOGUE PRINTING. ELECTROTYPING.

Done with expert ability for Florists, Nurserymen, Seedsmen. Write to

J. Horace McFarland Co.
. . . HARRISBURG, PA.

Ottawa, Canada.

ED. AM. FLORIST: In a recent issue you publish a letter from this city signed "M" which I must say is the nicest collection of trash I have read for some time. I feel hurt that you should be imposed upon. We have here at the capital a number of such correspondents and the reports they send to American papers are often disgusting. I care not what they write about politics but when they try this same game among florists I object.

If not taking too much space permit me to deal with his letter clause by clause, as they say in the city council. Passing his remarks about the great number of florists and other branches of the fraternity (as if every man who carried a spade was a horticulturist), he says the Experimental Farm takes in 1,000 acres. It does not amount to half that. Then he describes the vast amount of flowers required by Lady Aberdeen and society generally and that Chicago and New York have to be drawn upon for the finest blooms. I will buy him a new hat if he can prove that one box has been imported from Chicago this winter or last, and as for New York I got one box, and I am sure the other two florists did not get more. There are no standing orders with the wholesaler. When we are pinched Dale or Dunlop generally fills the bill.

Then he goes on to describe the opening of parliament. A great floral display is ordered. Here Chicago again comes in. Her Ladyship's dress is coming from Paris, with a train 20 yards long, borne by a score of gilt edge pages. Cæsar's Ghost! Where did he find all that out? Her Ladyship is a great admirer of orchids, and the Windy City is going to be drawn on so heavy. The floor of the chamber is to be strewn with flowers, etc., etc. I happen to be the florist that supplies the flowers for Government House and so far have been only called upon three times to decorate for a dinner, and they were by no means elaborate, and the steward of the house has got to know about the cost before we begin. If there was to be any such extravagance as "M" describes I think I would know something about it.

As for the rest of his trash I will dismiss it by moving him a vote of thanks for his taffy. We are all good fellows are we? Shake? We are certainly proud of our city as a whole, but don't like to blow about it. Population fifty thousand and but a small proportion are flower buyers, who generally go to the sea shore for the hot months, and with the exception of a few flowers and a funeral piece now and again, the florists have the rest of their time to repair and prepare for winter.

C. SCRIM.

NEPONSET • FLOWER • POTS

of Waterproof Paper, light, durable, unbreakable and cheap.

Tomato Growers have used them with success and proved their appreciation by repeated orders.
Cabbage Growers have tried them and duplicated their orders.
Market Growers of Verbenas, Alyssum, Coleus and other plants, which do not shun moisture, have used them extensively in repeated seasons.
Recommended for light and safe packing of tender and valuable plants, for the marketing of Ferns, Dutch Bulbs, Lily of the valley and the like.
Cost about 40 per cent less than earthen pots, and weight considerably lighter, thus saving in first cost and freight.

Express Rates.

Below appear extracts of trade interest from the classification adopted jointly by the following express companies:

ADAMS EXPRESS COMPANY,
AMERICAN EXPRESS COMPANY,
NATIONAL EXPRESS COMPANY,
NORTHERN PACIFIC EXPRESS COMPANY,
PACIFIC EXPRESS COMPANY,
SOUTHERN EXPRESS COMPANY,
UNITED STATES EXPRESS COMPANY,
WELLS FARGO & COMPANY'S EXPRESS.

PLANTS—Completely boxed, and packed so they may be handled without extra care, general special rate. Between points where no general special is in force, plants packed as above may be taken at 20% less than merchandise rate, pound rates; minimum charge 35 cents, prepaid or guaranteed.

SHRUBS—For setting, when boxed or baled and strawed, prepaid or guaranteed, general special rate. Between points where no general special is in force, shrubs may be taken at 20% less than merchandise rate, at pound rates; minimum charge 35 cents. This applies only to points reached by rail.

TREES—For setting, when boxed or baled and strawed, prepaid or guaranteed, general special rate. Between points where no general special is in force trees may be taken at 20% less than merchandise rates, at pound rates; minimum charge 35 cents. This applies only to points reached by rail.

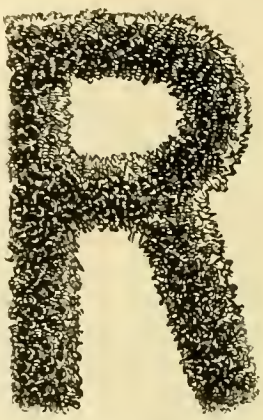
[The general special rates are usually about 20% less than merchandise rate, so the special reduction is 20% less than merchandise rate to all points.]

SEEDS may be carried between all points at merchandise rates (pound rates); minimum charge, 50 cents, for each company carrying, unless graduate rate or section D rates are less. But the above will not apply to exclusive offices of Wells, Fargo & Co. west of Ogden and El Paso.

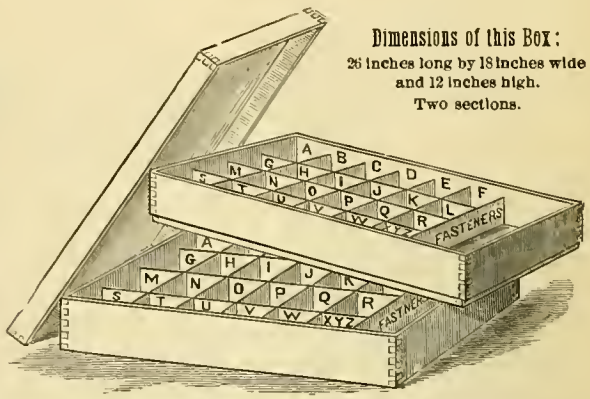
SECTION D.—PREPAID RATES—For manufacturers, publishers and dealers, to railroad points only, within the United States and Canada.

The following articles may be carried at *10 cents for each 1½ lbs., or less*, and for single packages *exceeding 1½ lbs., one cent for each additional two ounces or fraction thereof*, unless the graduated rate is less. If the through rate exceeds $8.50 per 100 lbs., no package weighing over 4 lbs., except single books, will be carried at these rates.

[We extract from the list the items of trade interest as below.—ED.]



BULBS, ONION SETS, SCIONS,
CATALOGUES, PLANTS, SEEDS,
CUTTINGS, ROOTS, SHOW CARDS.



NOTE.—Packages of bulbs or seeds exceeding 40 ounces in weight, 4 cents per package less than rate of ½ cent per ounce, unless regular graduate is less. When graduated or other rates quoted in this card are less than these, they should be applied. When shipments are ordered returned these rates apply.

Rate of Postage on Seeds, Plants, Etc.

We give below an exact copy of Rule 41 from the Official Postal Guide for 1894.

"By the act approved July 24, 1888, the postage on seeds, cuttings, roots, scions and plants is at the rate of one cent for each two ounces or fraction thereof. Dried plants, fruits and cut flowers are subject to the rate of one cent per ounce."

This wooden box nicely stained and varnished, 18x30x12, made in two sections, one for each size letter, given away with first order of 500 letters.

Announcement to Florists.

We desire to announce the dissolution of the firm of Sipfle Dopffel & Co., and to introduce to the trade its successor, The Syracuse Pottery Co., which will be under the management of William Dopffel and Conrad Breitschwerth. The business will be conducted as heretofore, except on a larger scale to meet the growing demand for our goods. We have accordingly enlarged our plant and capacity, and with unsurpassed facilities are now prepared to fill the largest order on short notice. Our latest improved machines are turning out the best and most serviceable flower pots in the market, and assuring you of our intention to lead in further improvements we solicit a continuance of your patronage in the belief that we can supply just what is needed at a price and in a manner satisfactory to all.

Send for price list and samples and we know you will give us an order.

CHICAGO, ILL.

History Repeats Itself.

The Historical Words "YOU GIT! YOU BET!" reversed.

You bet you git the best workmanship, the clearest lumber and the greatest value for your money when you send us your orders for

CLEAR CYPRESS GREENHOUSE MATERIAL.

We have had eleven years experience in this line. We introduced Cypress for greenhouse construction. We have made many improvements in the construction of greenhouses. We carry in stock many different designs of Rafters and Sash Bars, and everything else from the bottom of gutters up. Our facilities are large and we are prepared to furnish on short notice material of our own designs or any special designs you may want, and all of open-air-dried spot clear Cypress Lumber which we have bought for many years of one party at $4.00 to $5.00 per 1000 feet above the price of Cypress generally used, because this particular growth of Cypress is as soft and as free from warping as White Pine and has none of the knots, sap and other defects so common to White Pine. Every foot of our stock is guaranteed Spot Clear. Write for circulars and estimates. No trouble to furnish plans when necessary.

DEPOT FOR THE FAMOUS

Chambers & McKee Glass Co.'s Glass.

Mr. W. A. Burnham of the Lord and Burnham Co. delivered a lecture before the Massachusetts Horticultural Society on Saturday, Feb. 16th, his subject being "Greenhouse Construction." He spoke highly of American glass, the manufacture of which has now reached a high state of perfection, the double thick glass averaging nearly ten per cent. thicker and stronger than the French glass, which in a hail storm may easily mean the difference between a broken roof or one that stood the storm. **The Lord & Burnham Co. buy our Glass.**

Zion Gardens.

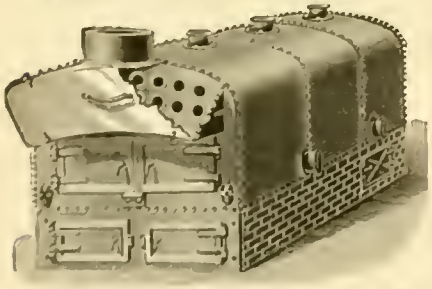
"Zion Gardens, Steward —— ——, Plants, flowers and Salads," is the wording of a sign to be seen in a Canadian city. On Saturdays the steward hangs out another sign which reads: "Visitors welcome every day but the Sabbath, which is the Lord, thy God's."

But sad to relate the steward was recently fined for transgressing a municipal law against working on the Sabbath. He said that if he was a Jew he had committed no sin but that if he was not then he had sinned. After this presentation of the case the magistrate fined him anyway to make sure. R.

R. W. CARMAN, Flushing, L. I.

Dear Sir:—Please send us by Star Union Line Freight (Pennsylvania Line), another 5 gallon can of Little's Antipest. We are not yet out, nor do we want to get out of it, for we think it indispensable and have sent you several customers by recommending it. Please hurry it through.

Very truly yours,
THE GOOD & REESE CO.



BROOKLYN, N. Y., Jan. 15, 1894.

R. W. CARMAN.

Dear Sir:—Please send me 2 gallons of Little's Antipest. Have used your Antipest with great results last season. I was troubled considerably with the large black ants in Greenwood Cemetery, but by using your Antipest drove them all off. Have also used it on all kinds of soft and hard wooded plants, with the best results. I would also suggest to you to send circulars of your Antipest to the different Supt. of cemeteries, also to florists who attend to plots in the cemeteries, as it will save them trouble and annoyances from the black ants who destroy plants and mounds.

Yours truly, CHAS. KROMBACH.

GREENHOUSE HEATING AND VENTILATING

Horticultural Architecture and Building.

HITCHINGS & CO.

Established 1844.

233 Mercer St., NEW YORK.

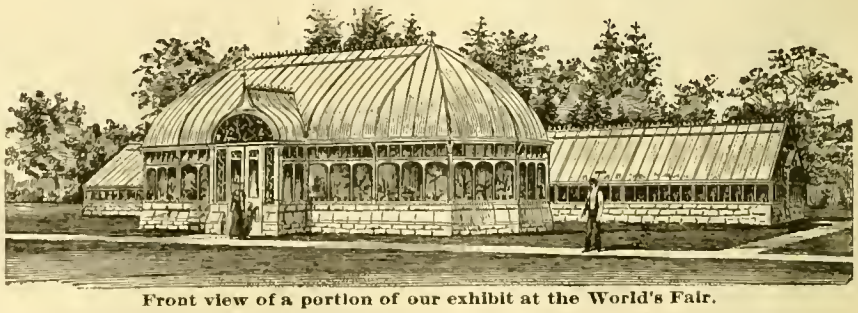
FIVE PATTERNS OF BOILERS.

NINETEEN SIZES.

Perfect Sash Raising Apparatus.

Rosehouses, Greenhouses, Etc., of Iron Frame Construction, Erected complete, or the Structural Iron Work shipped ready for erection.

Iron Frame Benches with the "Perfect Drainage Bench Tile" or Slate Top.

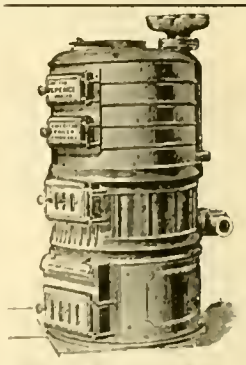


SEND 4 CENTS POSTAGE FOR ILLUSTRATED CATALOGUE.

LORD & BURNHAM CO.

Horticultural Architects and Builders,

STEAM AND HOT WATER HEATING ENGINEERS.



☞ Plans and estimates furnished on application.

Front view of a portion of our exhibit at the World's Fair.

. . . SEND FOUR CENTS POSTAGE FOR ILLUSTRATED CATALOGUE. . . .

LORD & BURNHAM CO., Irvington-on-Hudson, N. Y.

"SPENCE" (Trade Mark.) For Hot Water.

ARE YOU interested in the best modern system of heating your Greenhouse. If so write to us for Catalogues. We make a specialty of greenhouse heating.

18 TYPES. 174 SIZES.

FOR STEAM AND HOT WATER.

ADAPTED TO ALL KINDS OF FUEL.

American Boiler Company

BOSTON: 195 Ft. Hill Sqr. NEW YORK: 94 Centre St. CHICAGO: 84 Lake St. PORTLAND, ORE. 127 Sixth St.

THOS. W. WEATHERED'S SONS,

INCORPORATED.

Horticultural Architects and Hot Water Engineers

Send for Catalogue, enclosing 4 cents in stamps.

No. 244 Canal St., NEW YORK CITY.

GREENHOUSE HEATING.

BY A. H. FOWLER.

Explains fully all the best systems of heating greenhouses by both hot water and low-pressure steam. Tells you the points to consider in selecting an apparatus. How to adjust same to various locations; gives the results of the latest scientific experiments. Shows how to compute the number of feet of pipe required for a given space; draft and other important matters.

It is highly commended by Mr. John Thorpe and others. Postpaid, 75c.

Sent on receipt of price. Address,

Trees for City Use.

THE KINDS TO PLANT, AND HOW TO TREAT THEM.

BY JOSEPH MEEHAN.

[*Read before the Pennsylvania Horticultural Society at its February meeting.*]

The subject of trees for city use is one of interest to all of us. We know what a boon shade is to us, how all of us look for it, and how little of it those of us who live in the city get. There are, really, no shade trees in our city worthy of the name. It cannot be disputed that trees in a city have a hard time of it. Poor soil, leaky gas pipes, asphalt and other tight pavements, operate against them. On the other hand there are cities in which trees have been made to flourish, showing that streets lined with beautiful trees is not an impossibility. It hardly needs saying that we do not succeed in our city in having spreading shade trees, because of a lack of intelligent understanding of the requirements of trees. It will never perhaps, be much better than it is to-day, it certainly cannot improve much while every property owner plants a tree or not in front of his property as it suits him. And when he has planted it, he retains full control over it, chops the limbs off it—pruning it, he calls it—and otherwise mutilates it as he sees fit. The city should have control of the streets so far as the planting and care of trees are concerned; not till then will there be trees worthy of the name. I have said it will never be much better than it is under the present system because of a lack of knowledge of the requirements of trees. It was because I hoped to make some useful suggestions that I consented to your Secretary's request to prepare this paper for you this evening.

In regard to the proper kinds of shade trees for our city, any one who has seen those of Washington, knows that, with good care, almost any tree would answer. But we must take things as we find them, and not name kinds for general use available only in the hands of the skilled. In streets already planted here and there with trees, and where someone wishes to plant a few more, the following list may be selected from. They are named in the order I would prefer them for my own use: Norway maple, sugar maple, silver maple, linden, plane, catalpa, horse chestnut, paper birch and paulownia. Of these, the Norway and the sugar maple and the plane are the most planted at the present day. The Norway makes a dense and spreading growth, the sugar, a more upright one, the plane is noted for its pyramid-like outline. The silver maple fell into disrepute because that it was so often seen with mutilated trunks, made so by those ignorant of how to prune it. It is a tree of large size in time, so is the linden, the plane and the horse chestnut. The catalpa I would plant is the Western one, speciosa, which is much more of a tree than the spreading one, bignonioides, which is native to these parts. When birch trees are mentioned, visions of columnar trees with thin foliage come before us, but the paper birch is not such a tree at all. It has large foliage, and is of a rather spreading habit, and makes a good shade. Besides this we get its lovely white bark. The paulownia is but little known as a street tree; but it might be used to good advantage. Its very large leaves, and its blue, trumpet shaped blossoms recommend it. Many of you may be familiar with the large specimen in Independence Square. I would place the horse chestnut further up the list were it not for the leaf blight which sometimes destroys the foliage in mid-summer. But let me say here, that there are now well-known fungicides with which to preserve the foliage of our trees, and insecticides also, to use where needed. Spraying engines to do the spraying can be had, and fruit growers in all parts of the country are alive to the fact, and are preserving their trees and their fruit.

As to spring or fall planting, it makes no difference. The trees named do as well at one time as the other. Unless in localities where the natural soil exists in its original purity it is better to dig out a moderate cart load of soil and fill in with fresh, good earth. Rank manure should not be used at all, but that a year or more old, well decayed, may be mixed with the soil moderately, but good planters think it better that it be not in direct contact with the roots, so unmixed earth is first thrown in to cover the roots. It is well known good practice to do some pruning before planting. Just how much is determined by examining the roots. All trees lose more or less roots in digging. If but few are lost, but little pruning of the top is called for, if many are, a good deal of the top must come away. Non-attention to this is the cause of the loss of thousands of trees. Numerous branches make more mouths than the roots can supply, and in the struggle, the trees die. Do not be afraid of a good pruning of the top. There is another reason for pruning at planting. The trees may be unshapely, the branches too low, or the top spindling. Pruning, or cutting away of branches to remedy these defects, aid the roots at the same time. This pruning accomplished, the tree is ready to be planted. A good-sized tree needs two men, one to hold the tree and tramp or pound the earth in, the other, to throw the earth into the hole. Let the soil be as fine as possible, as the finer it is the closer it can be got into contact with the roots, a most essential point towards gaining success. As each shovelful is thrown in, tramp it in, and continue to do it until it is finished. In regard to watering these trees, it is rarely necessary with deciduous ones. The soil is generally damp

enough. I have, however, found great benefit from watering them when planted in a dry time, such as early fall often is. In such cases proceed with the planting as recommended, but when about half the soil has been filled in, pour a bucketful or two of water in, let it thoroughly soak away, then finish the filling in.

We will now suppose the trees are planted and are flourishing. The question of pruning then comes in. Taking the Norway and sugar maples as examples, but very little pruning will be necessary at any time. Sometimes a branch or two will show a disposition to get too much ahead of the rest, and must be shortened in. Branches may be too close together, and need cutting out. The proper time to do this work is just as soon as the need of it is perceived. Every summer and every winter look over your trees, and you can do with a small pocket knife what will suffice to make beautiful specimens of them and that which, if not done then, may need saw and hatchet a few years later. I have seen lovely large trees that were never touched with anything larger than a strong pruning knife. Many of our straggling, uncouth looking street trees, could have been made bushy, good shaped ones if a little annual summer pruning had been given them. Nothing equals summer pruning to make trees bushy. Take off the points of the growing shoots —it can be done with the finger and thumb very often—and out come the side shoots, a dozen in the place of one. Do not forget that where you cut in winter you get but one or two shoots in place of one, and those more rank than the one cut away, while summer pruning gives the dozen of small twigs that make the trees bushy. It is the ignorant topping of our street trees in winter which has made them a disgrace to behold. There are hundreds and hundreds of trees in our city which would have been far more satisfactory to their owners to-day if barbarians had never been allowed to touch them. The Carolina poplar, a really beautiful and fast growing tree when young and when summer pruned, being such a rank grower, is a favorite with those of the saw and hatchet, and the mutilated specimens of this tree do more to disfigure our streets than those of any other kind.

Among Chicago Growers.

It is always a pleasure to visit the admirably conducted establishment of E. Wienhoeber & Co., at Park Ridge. As usual the place this year is looking exceedingly well.

The range of rose houses, built in the most modern and approved style, contain a line of the leading varieties such as Beauties, Bridesmaid, Mermets, Brides, Cusin, Perle, Gontier, La France, etc. At the present writing most of the houses are off crop and don't show at their best, but the stock is growing vigorously and promises a heavy cut this spring.

Of Beauties we find two houses which show some very good bloom and a splendid new growth breaking from the roots. Mr. Earl, the foreman in charge, remarks regarding this variety: "With us the Beauty has always behaved well and the cut this year has been as good, as could reasonably be expected. At this season of the year you will find more or less crippled flowers but on the whole we find little trouble on this score. Neither are we troubled much with blind wood. These shoots," smilingly remarks Mr. Earl, noticing probably our rather skeptical glance which was directed to a number of rather lanky individuals several yards long, "will all set buds. You see when they run up so high as to threaten to raise the roof on the house, we bend them down horizontally for a distance and then tie the tip up straight again. This nearly always brings a bloom."

These roses as well as all other varieties except hybrids are grown on benches, the center benches with a slope to the south. The side bench on the south in both these houses is planted with Mme. Cusin. Speaking about this rose Mr. Earl remarks: "The Cusin with us is one of the most difficult roses to grow. We have experimented with it for a number of years, and though it has certainly not been a failure, yet we have never been able to do it real well. It evidently don't relish our soil, at least this is our opinion, so next year we propose to give it a trial in a different soil."

Bridesmaid is looking fine. Says Mr. E: "This rose is bound to become a prime favorite. As regards growth and habit it is identical with Mermet and with us readily yields to the same treatment. It flowers equally as free, the color of course is far superior." The weak point of this rose complained of by some growers that the flower stems are not strong enough to bear up the blooms well, is not seen in the stock grown here. It compares favorably in every respect with Mermet.

"What do you think of Kaiserin, Mr. Earl?" we asked. "Well, I like the appearance of the rose very much, and there is little doubt that it will prove a good seller, but the question is will it pay to grow it? I see by the eastern market reports that Kaiserin has made her appearance again in the market after a retirement of several months, during which time little or nothing was seen of her. Now that doesn't look very encouraging. A rose that produces little or nothing during two or three of the best months of the season hasn't got a first-class certificate. I should like to know a little more about this rose before tackling it, and if some of the brethren who have had some experience with it this season would enlighten us on some of these vital points through the medium of your journal, they would confer a great favor on many of us who are groping in the dark."

Hybrids, as remarked above, are the only roses grown in solid beds. There is only one house of them, mostly Anna de Diesbach and Brunner, just coming into crop and looking fine. "But," says Mr. E., "it don't pay to grow hybrids in solid beds. You have to devote the whole house to producing one crop in spring. Hereafter we intend to grow them in boxes outdoors during summer and after the chrysanthemums are cut out in the fall use those houses for flowering them."

The carnation houses are looking superb at present, being in full crop. Every variety grown is doing equally well and what is more not a trace of rust can be observed on any of the plants. The finest house, as far as appearance goes at least, is one of Portia. This variety shows up in grand style. The blooms are well formed, of good size and brilliant color. The same might be said of Tidal Wave, which is a mass of buds and flowers. The bench of Silver Spray is also very fine and shows very few ragged blooms. The flowers are large and the plants as seen here show their old-time vigor. There are after all few varieties that can beat this old favorite, when grown well. Lizzie McGowan is flowering freely, and on the whole has proved very satisfactory. The flowers, as has been stated before, were rather unsymmetrical in form and borne on too weak stems, but when grown well few varieties can equal it in a loose arrangement, as it yields more readily to graceful lines, than any other sort.

Grace Wilder is an old favorite here and has been grown successfully for a number of years. The blooms as noted here are of fair quality, but have the same fault, that of bursting the calyx, and are streaked and more or less imperfect in color, as often noted before in different localities. "As a producer," remarks Mr. E., "this variety leads any of the others grown here two to one."

Among other things of note is a very fine batch of mignonette of the Machet variety grown in a solid bed. "I prefer to grow this flower in solid borders," says Mr. E., "the roots like a cool bottom, and with us, grown in this way, the result is more satisfactory than when grown on benches."

Bulbous stock is forced here in large quantities and of the very best quality. Many growers have been complaining of the poor forcing qualities of tulips this season. The experience here is quite the reverse. The percentage of loss is reported not to exceed 5%, chargeable directly to poor quality of bulbs.

This establishment is equipped with the electric thermometer, a device, the usefulness of which is not as generally known as it should be. To those who are unfamiliar with this instrument it may be interesting to know the mission it is called on to perform. The device consists of a thermometer connected with an electric battery which sounds an alarm bell when the temperature reaches a given point. Let us suppose for instance that you wish to run your house at a mean night temperature of 70° with an extreme variation of 10°. You will then set your instrument by means of an indicator in the manner of an alarm clock at 65° and 75°. If your fireman is negligent in his duty or goes to sleep and allows his fires to go down, as soon as the thermometer touches 65°, the alarm will sound and in the same manner when the temperature runs up to 75°. The alarm bell may be located at any desired point within a reasonable distance by means of electric wires. At this place a wire leads to the sleeping room of the foreman, who will thus be warned at once if anything goes wrong in the houses.

What is a Fungicide?

BY B. T. GALLOWAY.

As far as can be ascertained, the word "fungicide" originated in this country less than eight years ago, the first record of its use being found in a letter from a correspondent in California to the Section of Vegetable Pathology in the United States Department of Agriculture. This letter, which relates to the use of chloride of iron as a remedy for downy mildew of the grape, was published in the latter part of the year 1886 in Bulletin No. 2 of the Section of Vegetable Pathology. The word has now come into very general use, as may be seen from a study of the foreign and domestic literature of the past eight years on plant diseases. A fungicide means a fungus killer, but for practical purposes this definition is entirely too broad. White arsenic, carbolic acid, sulphuric acid, and even man, are strictly speaking fungus killers, but viewed from the standpoint of the plant pathologist they can hardly be considered practical fungicides. What, therefore, would be a definition of a practical fungicide? In other words, if a farmer, fruit grower,

VIEW IN THE STOVE HOUSE, PALM VILLA, NEW ORLEANS.

or gardener should ask to have the word in question defined how would it be done? Of course in answering such a question many things would have to be considered, but laying aside all arguments it seems to me that the following definition covers the ground: A practical fungicide must have first of all properties detrimental or destructive to the growth of fungi; furthermore, it must be cheap, easily prepared and applied, harmless to the most tender growing parts, have sticking and wetting power, and finally must be as free as possible from qualities which would make or tend to make the parts treated injurious to health when used as food. The qualifications here mentioned are for the most part so obvious that very little further on the subject need be said. It might be well, however, to point out the difference between sticking and wetting power. A liquid may stick or adhere well to the foliage of a plant and still not effectively wet the former, that is it does not thoroughly and evenly cover the entire surface.

One great objection to many preparations used as fungicides is that they roll up in drops as soon as they strike the leaf, and by drying in this condition leave a large part of the surface unprotected. A liquid fungicide that covers the entire surface is said to have good wetting power, and if this is combined with adhesiveness it renders the preparation all the more valuable.

The question may arise as to whether we have at the present time a fungicide filling all the requirements mentioned above. We may say in regard to this matter that the Bordeaux mixture is practically the only one that can be mentioned. Many others have been tried, but have been found wanting in one or more points.

Palm Villa, New Orleans.

We present herewith two views in the greenhouses at Palm Villa, New Orleans, the residence of Mrs. T. G. Richardson, sent us by Mr. Harry Papworth, the gardener in charge.

In the stove house will be noted some fine anthuriums, marantas, ananassas, dracænas, etc. In this house is a Dracæna fragrans in a 10-inch pot which is 12 feet high and with every leaf perfect from the pot to the tip. In the center of the picture are seen fine specimens of Cibotium regale and Stevensonia grandifolia.

In the orchid house are seen two good angræcums, A. eburneum and A. sesquipedale, which are in the center of the picture, and other orchids in variety. The bench at the right is devoted mainly to cypripediums.

Construction of a Contract for Planting.

Florists and growers of shrubbery are peculiarly, in many respects, subject to the caprice of the elements. An exceptional and important decision on the effect of what are termed the acts of God on contracts, is the recent one of the Supreme Court of California in the case of Remy v. Olds. Here was a contract by which one party agreed, during the fall to thoroughly plow, level, and put in good condition to irrigate and plant in vines and trees, certain premises, which were before the first of April following to be planted with grape vines. He was prevented by heavy rains from plowing the land in the fall, but did it in the following February. To recover for labor performed, materials furnished, and money laid out and expended, he brought this action. The court, however, holds, first, that a rain in the last days of October would not be such an extraordinary event as would constitute an act of God excusing performance of contract. It was a seasonable event, one which was likely to happen, and which common prudence would have provided for. Moreover, while the doctrine that the act of God excuses a failure to perform a contract, being a good defense to an action for damages, it cannot be invoked to entitle a person to recover when he has not performed his part of the contract. In other words, even when liability for nonperformance would be excused, an impossibility to perform cannot be held equivalent to performance so as to sustain an action to recover damages on a contract. Another point decided, was that as the words "grape vine" might mean either a plant with a trailing or climbing stem, or a trailing stem in con-

tra-distinction to the plant, and both are used in planting vineyards, the party undertaking to plant grape vines could plant either those having roots or those known as grape "cuttings." A cutting would, therefore, seem to be the equivalent of a vine so far as language goes. How far this doctrine would be extended to other kinds of cuttings, it is impossible to tell, but this decision suggests that it will always be just as well to carefully distinguish when cuttings are not wanted.

Exhibiting Carnations.

At our convention in Indianapolis we had a banquet. At the banquet I was called upon to respond to the toast: "How to make Fall Exhibitions successful." Not being an impromptu speaker I replied very briefly that the only way was for us to get down to work individually and make them successful. This is however so important a question for carnation growers that I want to add a few remarks here.

In the first place, by Fall Exhibitions we all understand the chrysanthemum shows which come off between Nov. 1st and 15th. Now in order that the chrysanthemum shall not overshadow the carnation entirely there must be an abundance of room left for carnation exhibits and every grower in the vicinity should take an especial pride in seeing that that space is filled with good flowers and kept staged with good ones. To do this they should be staged between seven A. M. and the time the doors open to the public, and they should all be taken out that night after the doors are closed and either sent to a hospital or destroyed. This programme should be gone through with on every day the show lasts. There is nothing so detrimental to the carnation in the eyes of the public as leaving flowers on exhibition after they begin to deteriorate, and they are sure to do this the next day after they are staged.

Our Pennsylvania Horticultural Society has made a step toward overcoming this evil by offering premiums in the same classes on two different days; this will have the effect of getting at least two fresh lots in during the show. But this will not remedy the evil entirely. It remains with the growers whether or not they have sufficient love for and pride in their carnations to make the slight sacrifice of putting fresh flowers in daily and keeping the exhibits in respectable shape.

As a suggestion, would it not be a good idea to judge the carnations the first day and the last day of the show and rule out every exhibit which was not renewed daily? There would of course have to be exceptions made to this rule for flowers from a distance but they should be judged the first day and taken off the benches that night.

Another point, while on the flower exhibit; there should be not less than 25 blooms to a jar and they should have enough carnation foliage with them to present an artistic bunch and not look like samples from a commission house. The vases or jars should be of various sizes to correspond with the different varieties as what will hold one sort nicely will not another, and the flowers should not be sacrificed to accommodate the vases. There should also be a number of very large vases containing 100 or more blooms each of some of the showy varieties. In arranging the exhibits it should be done with an eye to the general effect and everything should be neatly labeled, with the grower's name attached if you wish. Everything should be done to encourage superiority in the exhibits and the staging of them. A little extra care and labor is bread thrown upon the waters and it will return tenfold at the box office, the store and the greenhouses.

Next week I want to say a little on the growing of carnations in pots for exhibition purposes, a feature that we hope to see becoming more frequent at every show, spring and fall. A. M. HERR.

New York.

Easter trade in New York was a surprise. The business done in plants was undoubtedly the largest on record, and the cut flower business proved itself to be in the healthiest condition possible. Just what struck the cut flower market seems to be something of a puzzle. Early in the week wholesale prices stiffened up considerably, carnations especially taking a surprisingly strong upward turn. To be consistent with past history this self assertion on the part of the cut flowers should have resulted in general ruin on the last day of the week. Everybody has become so used to a big surplus of stock and slaughter of prices on the day immediately preceding the holiday that any variation from this rule was the last thing looked for.

What did become of the stock of roses, carnations, violets and lily of the valley which came in on Saturday morning is an unsolved mystery. The retail store people were too much engrossed in their plant trade to give much thought to the cut flower question until evening, and there were no special indications of great activity at the different wholesale establishments. The Greeks were as numerous and clamorous as usual, particularly at the 34th street market, upon which they descended in the early morning in a horde that would have made a good detachment for Coxey's famous army.

By noon time it began to be apparent that those who wanted good roses, carnations and other desirable stock would have to bestir themselves, and when towards evening the second shipments commenced to arrive from the growers in various sections the contents were found to be totally inadequate to satisfy the demand. As an indication of the violet market one shipment of over 40,000, which came from George Saltford to John Young may be noted, and the whole lot went at once to a single retailer. Lily of the valley even, which was almost invariably of inferior quality, seemed to catch the current and it all vanished, much to the surprise and delight of those who held it and expected to find it left on their hands.

As to roses and carnations all that can be said is that they went at sight, although the roses averaged small and poor, and first-class blooms were in a minority. The prices on roses, however, did not advance much, and no attempt was made to take an unfair advantage of the buyers by jumping prices on them at the last moment. There was a fair supply of hybrids obtainable, mainly Baroness Rothschild, Ulrich Brunner and Luizet. American Beauty made a poor showing. The great majority of blooms of this variety were exceedingly poor.

Some things there were, however, that could not be unloaded. One of the worst of these was mignonette. There is entirely too much of this flower grown in this vicinity. Smilax, too, was unsalable. Tulips, although not seen in large quantities, sold but poorly, as did also candidum lilies and callas. Roman hyacinths were also among the unfortunates. Harrisii lilies accumulated with some dealers, but a possible reason for this was the terribly bruised and battered condition of much of the stock. There were a few sweet peas in market, which brought twenty cents per dozen wholesale.

The plant trade for Easter has assumed enormous proportions. Nearly every retailer had an extra store or two for the occasion and this department occupied their attention almost to the exclusion of anything else. The retailers in New York are as a rule retailers only and do not, as is the case to a considerable degree elsewhere, grow any of their own stock. They nearly all depend for their Easter plants on the growers here who make a specialty of this class of stock, hence it is that the stock in the various stores was of a similar character throughout. Azaleas, hydrangeas and lilies predominated everywhere. There was also a fair representation of rhododendrons, genistas, astilbes, lilacs, marguerites, heaths, Dutch hyacinths and other bulbous stock, with a sprinkling of metrosideros, acacia, roses and kalmias.

Azaleas easily led in popularity. The quantity of these disposed of was unprecedented. All colors seemed to be in demand, medium priced plants from five to ten dollars having the preference with the better class of customers. The quality of the azaleas could not have been better. Occasionally a few were seen that had been in bloom too long, but as a rule they were in splendid shape. Lilies were the only plants which came any where near the azaleas in popularity. Low grown longiflorums were the favorites. Tall grown Harrisii did not sell nearly as well as last year. Genistas have lost ground badly. They serve to make a store front look brilliant, but as salable stock for Easter they have had their day. Hydrangeas are in the same boat. Just why it is hard to understand, for they are good keepers and make a rich show. No better plants could be imagined than those offered; they were well bloomed, stocky and the shades of color varied from deep pink to soft blue, but very few wanted them. The same was true of the little Thomas Hoggs, of which very neat specimens were offered. Rhododendrons came next to the azaleas and lilies in popularity. Dutch hyacinths in pans and pots of ten or a dozen plants and pretty, well bloomed violets and marguerites also sold well. Lilacs did not sell as well as they deserved. Metrosideros, kalmia and acacia were almost dead stock.

Immense bows and sashes of gay ribbons inscribed "Easter Greeting" were seen in profusion everywhere on plants, and celluloid pots and baskets were used as receptacles. Many very pretty combinations were made. Brilliant hyacinths in baskets of white and gold were tied with a broad satin ribbon of their own color; heaths were put in baskets of white and silver, with pale blue sash, and few lilies were sent out without a ribbon of some color tied round the stems. The surface of the soil in the pots was neatly covered with moss or selaginella and everything done to make the plants appropriate for the drawing room.

An innovation was the use of crepe paper about the flower pots. This was

VIE IN THE ORCHID HOUSE, PALM VILLA, NEW ORLEANS.

used in various shades quaintly gathered together and held in place by narrow ribbons. As an inexpensive and pretty substitute for baskets and fancy pots it is a success. The only danger is that it is apt to be overdone, until like the old fashioned bouquet papers it meets with disfavor.

The Union Square flower market is in full bloom every morning now. On the day before Easter every wagon that could possibly squeeze in was there, but the trade was not up to expectations. Bedding stock people are not ready for; and the chilly wind that blows across the square in the early dawn of a March morning is neither conducive to the health of a lily or azalea, nor comfortable for plant buyers.

One of the big "bargain" stores in Brooklyn advertised "Boxes of Horricide or Bermuda Lilies" for Easter. As the goods referred to were rotten Bermuda stock, possibly the astonishing title was not misapplied.

Another Brooklyn establishment offers from the stock of a well known nursery plants at such disproportionate prices as: "Kentia palms, 19 cents; Sago palms, 65 cents; and Zatania palms (What is it?) 3.75." Brooklyn needs a fool-killer.

R. K. Young has opened a wholesale cut flower store at 482 Sixth avenue.

YOU CAN'T AFFORD to do business without a copy of our trade directory and reference book.

Philadelphia.

The weather of the past week has been all that could have been desired save for the temperature, which until Friday night was far too warm. Never before were there so many lilies about, they seemed to be everywhere, the regular stores were full, vacant buildings being rented and palms stored to make room for Easter stock. Empty stores were rented in many places and Easter plants sold by outside parties, while along the streets in the busy centers of the city small growers, and large ones too for that matter, as well as hucksters, were to be seen side by side, their displays taking up in some cases almost the entire block.

Prices went all to smithereens and lilies could be bought on the street retail in some cases at the lowest wholesale price. With few exceptions the stock was not nearly up to the mark; many, in fact three-fourths of the plants, were very tall and the flowers very soft and flabby. The stores as a rule sold their plants at 25 cents per flower and bud, not counting the very small green buds. With some the price was 20. In one block containing two regular stores both sold all their stock, one for 20 and the other for 25. In addition to the immense quantity of homegrown flowers a large consignment arrived from Bermuda but these were very unsatisfactory, being nearly all soft and worthless. All other stock, with the exception of hydrangeas, was good. This plant was poor this season, making a short stunted growth which made the pot seem very large.

There were a lot of azaleas which were good and sold very well as did the genista. It is a pity that this beautiful flower closes up so soon; 24 to 36 hours in a city store or greenhouse puts it to sleep most effectually. For the Easter trade Mr. Harris, who supplies the Phila. market with this plant, sent in a fresh supply each day and in its perfect state it was one of the best sellers.

The volume of business was equal to that of former years although in the early part of the week it seemed to lag. Friday and Saturday were good, especially Saturday, which eclipsed anything ever seen before. People pushed and jostled each other like high tide in a chrysanthemum show and as fast as the busy clerks could handle the stock it was sent out. All the stores say they could have sold more if they could have waited on the people.

Orders for cut flowers were refused quite early in the day, the small stocks not being equal to the demand. Roses were scarce, that is in all except the hybrid class. The warm weather had brought them on so, that most of the places were off crop and there were not near enough to go round. The larger teas sold for 6 to 8 and in some cases 10 and 12 were asked; the smaller classes brought 4 to 6. Brunners were 4 to 5 per dozen, and Laings and Luizets 12 50 to 25. Carnations, while fairly plentiful, were in

great demand and few of them found time to go to sleep. They range in price from 2 to 3 for good ordinary and 4 to 5 for extra fancies. Bulbous flowers were plentiful, tulips at 4 being very fine. Other stock sold at the old prices, valley 3, Romans 1.50 to 2, daffs 3. K.

The warm weather of the past few weeks having brought the crops of some kinds of roses in one week sooner than the grower had figured on getting them, so as to try to satisfy the storekeepers by having a good supply for Easter, many varieties were somewhat scarce. Not that it made any difference to the grower as far as dollars and cents are concerned. The retailer, however, always puts the prices higher at this season, in fact almost as high as he gets at Christmas time, but if the grower had the audacity to ask an advance in the wholesale prices he would be unceremoniously "turned down" for the balance of the season.

It happened to be the grower's inning this Easter, especially does this apply to those growers who make cut flowers their specialty. Unfortunately they (the growers) had not the satisfaction of getting better prices, only in noting the anxiety of the storekeepers in getting sufficient flowers to fill their orders. Am not positive about this, but I am inclined to think that the retailer cherishes unkind feelings against the growers, who have been faithfully supplying them with what they needed in flowers the whole season through, for as we delivered our Beauties, Brides, etc., on Saturday (day before Easter Sunday) morning, they appeared to feel as though we had it in our power to produce just as many flowers as they wanted, in one night, and the common remark was: "Why, you have not left me more than one third of what I expected you would leave me."

It was really amusing to see one of our enthusiastic city florists, who had carefully studied the time tables of both the Phila. and Reading R. R. and those of the Penna. R. R. (he admitted he had not slept a wink all night) to find out, when possible, what time the growers would be likely to arrive, so as to be there, on their arrival, and feeling that he was not sufficiently fleet of foot he hired a hansom, selecting one to which was attached a milk-white steed—believing there's luck in white horses—and the tires of the wheels —figuratively speaking—were kept red hot as he frantically travelled from one depot to the other, about three squares apart, hoping and praying to catch the growers before they could go their rounds, among the other storekeepers.

Some of the retailers even went so far as to express regret that the growers had not given them due notice that they would put the wholesale prices up to the same as those charged at Christmas. This, they claim, would have helped them to bill their orders with more satisfaction (but why?), and from a grower's standpoint I can safely say there never was a season when the grower needed that help more than he does the present one. Only three or four days ago, when we would call to leave our daily portion to that august personage, the dealer, when he could find no other excuse to turn the order down, would complain about the quality.

The scarcity of cut flowers this Easter was not due to the lack of number of square feet of glass devoted to their culture in this locality, but the peculiar and gloomy winter has wrought ruin to many a rose bud, and the exceptional warm and unseasonable weather for two or three weeks past precipitated the crops from one to two weeks ahead of the calculations of most of the growers. From the present outlook if trade is anything like what it ought, should, could, or might be, there will be only just about enough flowers to go around nicely, without causing any great glut of flowers for the balance of the season.

Oh! what a glorious thing a market would have been on last Saturday, with a good sharp auctioneer to have taken charge of the sales. Methinks the growers would have been able to pay some of their accumulated bills, or perchance lifted some of the mortgages with which some of the establishments may be encumbered, with the proceeds, for as I understand a market, everything that is sold therein, has to be paid for in spot cash.

The flowers having a briney flavor, so much commented upon in former years, were very little in evidence this Easter.

F. PIERCE.

Boston.

Widespread satisfaction prevails among the Boston florists over the record of Easter trade, and the confident predictions made by some that we should see the best Easter we ever saw seem to have been realized, judging from the jubilant claims one hears. An amusing feature about the situation, however, is the way in which each one, while telling of his own success points out with a chuckle how his competitors "got stuck" on one thing or another.

Contrary to general expectations the supply of lily plants was equal to the demand. The number available was much larger than good judges had believed possible. This was no doubt in part owing to the weather, which has been so warm and pleasant that many lots which were supposed to be away behind hand, finally came in on time. The proportion of longiflorums to Harrisiis was larger than usual and the longiflorum seems to have been much more generally sought after. Azaleas were superior in quality, and much larger in quantity than ever before, and they sold well.

The wholesale florists all took a turn at the plant trade this year, they having in each case secured an extra store or two for that purpose. This action, like that of Wm. Edgar, one of the large growers, who has taken a store on his own account each year, was naturally looked upon with much disfavor by the retailers, who threaten to get even. But as none of them have ever supported the local commission trade consistently nobody seems to worry much as to the consequences and apologies are not likely to be forthcoming. The large department stores have all been into the lily business this year. Profiting by their past experience they knew better than to be deluded by the "Bermuda flower" humbugs and bought their stock from the legitimate sources.

The number of lily plants disposed of through these extra channels was enormous, and the trade could not possibly have been handled by the regular retailers with their usual resources. It is doubtless true that many people bought who would not have patronized the regular florists in any event. The narrow margin of profit figured by the "department" people was a big inducement for small buyers, and the principal source of trouble to the florists, but this was offset in some degree by the fact that these people in their advertisements stated that they would not undertake to deliver any plants, and that customers must make their own provision for getting them home. When they come to figure up their special expenses and shrinkage on damaged blooms, they will perhaps realize that cut rate methods should be adopted with caution when tampering with flowers.

The prices obtained at wholesale by Boston growers for their lilies were far ahead of those prevailing in New York or Philadelphia, probably from 40 to 50 per cent more. Their great advantage lay in the prevailing impression that there would not be plants enough to go round, and the consequent eagerness of buyers to secure the desirable stock in advance. The situation was also taken advantage of to count sharp on buds and the rule of counting every bud on a plant at the same rate as a flower was pretty closely adhered to, although not without much controversy.

The cut flower trade was all that could be desired. The weather on the day preceding Easter was charming and the customers were all out in force, the streets presenting a holiday appearance, which effect was heightened by the many special decorations in store windows. Roses, carnations and violets were the great favorites although everything seemed to go. There was practically nothing done in the way of made up work by any of the florists and the "pieces" for church decoration were few and far between. Loose flowers were the invariable rule.

Wholesale prices held up steady all through the week. Carnations furnished the greatest surprise and the stubbornness with which the high prices hung on was the prevailing topic. Four to five dollars a hundred was obtained without difficulty for good stock. Roses of all kinds sold for outside prices and of certain favorite varieties there were not enough to go round.

Among the prettiest novelties brought in were some pot grown clematises from Mann Bros. bearing about a dozen flowers each, of which an enormous quantity could doubtless have been sold if they could have been obtained.

L. H. Foster made a triumphal tour of the city one day recently with some blooms of carnation "Richmond" which measured 3½ inches across the flower and stood erect on stems 2½ feet long. He wants it distinctly understood that Boston is on deck when carnations are mentioned.

Messrs. F. R. Pierson and Frank Hamilton of Tarrytown, New York, spent one day in Boston last week.

Chicago.

The Easter trade this year was fully up to last season notwithstanding the disagreeable weather Saturday and the extreme cold Sunday. It is agreed on all sides that had the weather been at all favorable the business would have exceeded by far that of any previous Easter. As it was, trade on the whole was satisfactory. Very little stuff, and that of inferior quality, was left in the hands of commission men; this too could have found a ready market had the fakir been able to operate. It was a cold day in more senses than one with the street merchant. Saturday forenoon the weather was yet fairly pleasant enough to be out of doors, but as the wholesale men in most cases would pay no attention to him, he had to wait until the regular dealers were supplied, and by the time his

turn arrived, a strong cold wind began to blow, raising great clouds of dust, which made street taking anything but a profitable business, and on Sunday, with the thermometer at 15°, every member of the fraternity was banished from his accustomed haunts. The down town dealers were in a large degree the gainers by this state of affairs, but the business nevertheless suffered greatly with them also. Comparatively few people were out on the streets Sunday morning. The fair sex, noted in very limited numbers, who braved the wintry blasts of a northwest wind were muffled in thick furs instead of sporting a new spring gown adorned with a bunch of flowers, as is proper at Easter. Indeed if this had been Christmas, instead of Easter, the weather would have been in perfect harmony, as even a flurry of snow now and then, was not missing to make it realistic.

The plant trade suffered more in consequence of this state of affairs than did the cutflower business, but in spite of all obstacles the sales in this line were large. There is no doubt that the demand for plants at Easter is constantly increasing. Owing to the pleasant weather which prevailed in the early part of the week, plants began to move early, but a large quantity of stock was sold for delivery on Saturday and Sunday, and that is where the rub came in. No one was looking for such an extreme change and many an old and experienced campaigner was caught, and now mourns the loss of a lot of plants by freezing, owing to insufficient care in packing. The loss was heaviest in Harrisii, the high winds prevailing making it almost impossible to handle these plants without bruising the flowers more or less. The demand for these was heavy and good prices were realized, but owing to great loss in handling the profits will scale down considerably.

The stock of lilies, as well as most other lines of Easter pot plants, was much larger than in any previous year and was uniformly well grown. Azaleas were exceptionally good; the stock was the finest ever seen here at Easter and met with a brisk demand. Rhododendrons were also very fine but sold rather slow. Genista with some dealers moved briskly while others report a rather slow sale. Dutch hyacinths were offered in enormous quantities, which were pretty well cleaned up. Deutzias and spiræas sold well and very little stock was carried over. Daffs and tulips on the other hand met with very little demand.

The demand for decorative plants for churches was rather light. Blooming plants, particularly lilies, marguerites and azaleas, etc., with the addition of cut flowers formed the main decorative features. Very few set pieces were noted.

The supply of cut flowers with the exception of Harrisii and A 1 roses was ample to meet all demands. But there was no great glut of any one variety with the exception of Romans and mignonette and prices ruled firm throughout.

Harrisii, contrary to all expectations, were really scarce. As most of the dealers were expecting a heavy supply great efforts were made by them to induce dealers to place their orders early. A number of sales were effected early in the week at figures as low as $50 and $60 per thousand, but by Friday morning it was apparent that the supply had been either overestimated, or, as was probably the case to a large extent, a great amount of the stock was sold by the growers to dealers in pot plants. At all events the boys who had taken their chances on low figures and neglected to put in their orders, were disappointed. Prices meanwhile were stiff at $10 for good stock, and on Sunday morning advanced to $15.

Roses, noticeably in good quality, were scarce, as had been expected. Although no great amount of pickling had apparently been indulged in yet there was a large amount of soft and poor quality stock, which could only be disposed of owing to the fact that very little really good stock could be had. On Saturday every flower was sold out clean, but of shipments received Sunday morning, a few lots remained in the hands of wholesale men, as trade was almost dead on that day.

The supply of Beauties was very limited, and with the exception of a few small lots of inferior quality, the best sold at $25. In hybrids too the supply was short. Some fine Brunners, Laings and Diesbach were noted, which sold at 30 to 35 for first quality, and demand far in excess of supply. Jacques were fine, but also short in supply; prices ruled firm at 16 to 18.

La France is greatly improving and some very fine stock with extra long stems was noted which sold readily at 10; regular stock of good quality at 6 to 8. Mermets hold up fairly well in color and quality. Of Brides the supply was quite large but not nearly equal to demand; from 7 to 8 were the ruling figures. Meteor, mostly inferior stock, sold briskly at 8 to 10, Perles 5 to 6, Gontiers (extra fine) 5 to 6, common grades went at 4.

Carnations were very plentiful and averaged fairly good in quality. In some lines, more particularly in reds, the supply was in excess of demand, but prices kept firm. Common sorts were $2 and fancy $2.50 to $3. The supply of Portia was unusually large and of this variety quite a stock was left unsold.

Violets were very plentiful with rather light demand. Good fresh stock, that hadn't lost their fragrance found a good market at .80 to 1.00 but the large shipments of these flowers received from far off points proved an almost total loss. This stuff is generally disposed of by the fakir, but as these gentry were not in evidence this Easter, the stock had to be consigned to the barrel.

Bulbous stock went fairly well, and very little stock was left unsold. Tulips, particularly in the light shades, sold well at 4, daffs slow at 3, valley at 3 to 4, Romans 2 to 3; the latter were very plenty, and a considerable amount of stock was carried over. The stock of Dutch hyacinths was large and of very fine quality generally; they sold at 8 to 10.

Mignonette, for the first time this season, was far in excess of demand; the stock was very fine but met with rather slow sale and quite a lot was carried over.

Retail dealers without exception report a satisfactory trade, and by the way business opened on Saturday morning hopes were entertained of being able without much effort to beat the record of any former season, but Sunday put a damper on any such aspirations. The dealers in the downtown district were not so much affected as regards Sunday trade. With them most of the business is transacted on the day preceding a holiday but with those located in the residence districts it is quite the reverse; here the holiday proper is depended on for a good part of the business, and if the weather be such as was experienced last Sunday it makes a serious difference in the day's business.

Nevertheless the aggregate amount of business was fully up to last season, and when we consider that most flowers were sold at lower prices than ever before it would warrant the assumption that a larger amount of stock has been sold than at any previous Easter.

The demand was mainly for cut flowers, very few designs for churches or memorial pieces were called for, the same might be said of baskets, and other Easter designs.

Harrisii took the lead and some difficulty was experienced by some of the dealers in filling orders with good quality; $3 a dozen was charged at retail. American Beauties sold at $6 a dozen and hybrids at $8, first-class La France $3, Mermets, Brides and Meteor $2, and small teas at from $1 to $1.50. Brides met with large demand and some orders had to be refused as the supply ran short.

Violets generally sell well at Easter, but as these flowers are bought largely for the purpose of wearing to church or on the street, and this being out of the question with the thermometer at 15° it followed that the demand was very light, and a number of dealers who had laid in a large stock had more or less stock left on hand.

During Easter week some very fine window decorations were seen at various retail establishments, notably that of Mr. Halle on West Madison St., which consisted entirely of blooming plants. A large pyramid of Harrisii reaching to the ceiling of the store formed the central figure, flanked on one side by a group of superb genistas and on the other side were arranged azaleas and hyacinths in harmonious shades, the whole forming a striking picture which couldn't fail to attract the attention of every passerby. M. F. Gallagher's window was also very attractive and so was Friedman's on Michigan Ave., but few florists seem to pay much attention to distinctive Easter decorations. In most windows we note simply an assortment of commercial stock arranged with more or less, often considerably less, taste.

There was joy in the hearts of at least two of the members of the craft, Messrs. Wm. Smyth and John Zeck. Both discovered in their nests, not an Easter egg but something far better. Honors are even; both are daughters.

Among recent visitors were Mr. H. S. Van Waveren, representing Segers Bros., Lisse, Holland, and Mr. Ingram, representing Hugh Low & Co., London, Eng.

At a meeting of the stockholders of the Chicago Cut Flower Exchange held yesterday (Wednesday, 28th inst.) a resolution was presented by the board of directors providing that in future commission dealers be excluded and that the exchange conduct a commission business, in addition to renting space to growers as before. There was a lengthy and spirited debate on the subject. Finally a vote was taken in which 230 shares were represented, 209 of which were in favor of the resolution, but as it required 241 shares to make a quorum the matter was left unsettled and the meeting adjourned subject to the call of the President. This result was brought about by numerous share holders refraining from voting though present.

Henry Mundt is sending in superb carnations now; some Daybreak and Tidal Wave recently noted were of extra size and quality. They are disbudded; Mr. Mundt has reason to believe in the efficiency of this practice.

Visited Chicago: Mr. Chas. Dannacher, Davenport, Iowa; A. W. Bennett, Supt. Schenley Park, Pittsburg, Pa.; Harry Bunyard, Short Hills, N. J.; Wm. Ingraham, London, England.

Worcester, Mass.

With the thermometer way up in the seventies outdoors and not a cloud in the sky for the last eight days it has been very hard to hold anything back for Easter.

Most of the growers in this vicinity started forcing bulbous stuff, Harrisii lilies, etc., considerably earlier than usual, thinking that they would need every bit of the time to get stuff in for the 25th of March, but this unusual hot wave knocked out all these plans and brought most of the stuff in the cold cellars again. Notwithstanding this, I think the supply of flowers for Easter, will be adequate, with the probable exception of roses, unless the demand is much larger than usual.

On March 8th, the opening annual exhibition of the Horticultural Society, was held and eclipsed all previous openings. The weather being warm and pleasant, the people turned out in great numbers and the hall was uncomfortably crowded during the afternoon.

Perhaps the most popular feature of the show was the exhibit of Mrs. Josiah Lasell of Whitinsville, Mass., in charge of genial Geo. McWilliams, who staged his display on the center tables with his customary good taste and judgment. Large vases of superb, long-stemmed Brides and Mermets were placed in the middle of the tables and around these, nestling in the delicate foliage of Asparagus plumosus, was a display of orchids that was never equalled in the history of this society. Mr. McWilliams showed twenty-seven varieties of the best types known to us at the present day and all grown under the best conditions. His exhibit included Cattleyas Warneri, Trianæ, chocoensis and Percivaliana; Cypripediums Leeanum, Boxalli, Dominianum and a seedling after the Lecanum type; Dendrobiums Ainsworthii, splendidissimum, nobile, n. Sanderianum, n. elegans and n. Allanianum, these last three being among the rarest; a Cymbidium Lowianum, which McWilliams claims to be very best known and for which he has received many offers from London.

Next to the orchids, the display of carnations in vases was the most popular and was a revelation to those who admire the "Divine flower" H. F. A. Lange took the lead in this class and showed fifteen of the best varieties. Mr. Lange's flowers were large and well grown on long stems and showed the good effects of liberal feeding and disbudding. F. A. Blake of Rochdale was awarded second, for an especially good stand of first-class varieties. Among the other exhibitors were W. I. Wood, C. D. Thayer and H. B. Watts. The twenty vases of cut blooms, always a taking feature, were very fine and made a brilliant show, Lange first, F. A. Blake second, C. D. Thayer third.

The call for cyclamens in pots brought out a large number of exhibits of superior merit. C. D. Thayer captured first, with W. I. Wood a close second, and A. A. Hixon third. The brilliant coloring of the azaleas helped make the show attractive. The plants shown were rather small though well shaped and flowered. W. I. Wood and C. D. Thayer received the first and M. F. Brierly, H. A. Jones and A. A. Hixon, also received awards for meritorious exhibits. H. F. A. Lange came out a winner in the display of hyacinths in pots, which were especially good. Among the best varieties shown were Gertrude, Maria, Regulus, Lord Macaulay, Leonidas and Baroness von Tuyl. A. A. Hixon was awarded second and C. D. Thayer third. Cinerarias, primulas and callas were also exhibited in large variety but were not especially noteworthy. H F. A. Lange showed some fine vases of Brides and mignonette and C. D. Thayer had a nice display of narcissus, spiræa, ericas and hyacinths.

The next exhibition will be held on April 12 and calls for tulips, hyacinths, narcissus, zonal geraniums and cutflowers.

SEEDLING.

St. Louis.

The Easter rush is past, and the prevailing feeling is one of contentment at the amount of trade done; although complaints are heard from various sources, in regard to minor points that did not turn out as expected. The principal kick, if it may be called such, is at the unseasonable weather prevailing during the three weeks preceding Easter, and the consequent loss of bulbous stock that could not be held for that occasion. This was succeeded by a cold wave, which reached here Saturday morning, accompanied by a heavy wind: this was death to the market trade in plants, which had promised during the week to be exceptionally good. Buyers were scarce, and what plants sold went very low, more it seemed to get rid of them, than to get their value. Among the market plants some fine specimens of azaleas, genistas and lilies were noted. The cold increased during the day, and before Easter morning the glass registered 17°, and everything was frozen up solid; considerable injury is expected to result to the fruit crops and shrubs, many of which are in flower and well started into growth.

The shipping trade still continues to boom, several firms reporting being ahead of this time last year. Trade in cut flowers was brisk, stock with the exception of Harrisiis being scarce, with prices about as follows: Beauties 50 cents, Brides and Mermets 8 to 10, Bridesmaids 10 to 12, Watteville and Cusins 6 to 8, Perles and Woottons 5 to 6, Harrisiis 7 to 10. Perles and Woottons were noticeably scarce; Perles in fact have been so most all winter. The commission men are as a rule satisfied, although some shippers cut off their supply owing to the home demand. Thursday was as busy a day as Sunday, the amount of stock called for being in excess of former years. Prices ruled lower however, but the change from the inactivity that has prevailed for some time back was refreshing to behold.

The meeting of teams 3 and 1 of the Bowling Club on Wednesday evening was slimly attended, owing to the amount of work on hand, and a meeting of the Exhibition Committee called for Thursday evening to transact important and necessary business, succeeded in bringing out two instead of five members. It is unfortunate that members accepting the duties imposed by being placed on committees, neglect their performance without a second thought regarding the matter.

Mr. W. Ellison has instituted suit against the members of the late firm of Hanft & Benton, to secure payment of accounts incurred by that firm while in business.

R. F. T.

Liability of Express Company.

A decision of considerable interest to florists has been rendered by the Court of Civil Appeals of Texas in the case of Wells, Fargo & Co. v. Battle. It would seem from the statement of facts in the case that the party last named delivered to the Pacific Express Company, at one point, two bundles of fruit trees, vines, and flowers, and a package containing an order book, to be transported and delivered at a point on the Wells, Fargo & Company's line, the same being consigned to himself. The nursery stock was delivered, but the package containing the order book was not delivered, it was alleged, within a reasonable time. The trees and shrubbery were sold for the aggregate sum of $526, and the purchasers thereof had been notified to call for same on a given day, but because of the nondelivery of the order book, delivery of only a portion could be made, and although the shipper exercised proper care and diligence to preserve and sell the balance of the stock, it perished on his hands. Wherefore, he brought his action for damages, and obtained a verdict and judgment in the county court for $379.10.

In reference to the measure of damages the court instructed the jury as follows: "The jury are charged that in ascertaining the amount of damages sustained by plaintiffs in this case, if you find from the evidence that he has sustained any damages, under the instructions hereinbefore given, you will consider the aggregate amount of the orders and contract prices for the fruit trees, vines, and shrubbery as shown by the evidence, and find for such amount of damages, if any, that plaintiff has sustained by the failure of defendant to deliver said order book, less such amount as shown by the evidence plaintiff realized from said fruit trees, vines and shrubbery, and less such sum as from the evidence you believe plaintiff would have failed to collect on said orders and contracts if said order book had been delivered to plaintiff by defendant within a reasonable time." But this charge, the Court of Appeals says, does not correctly state the law, because, unless the express company sued had notice, when it received the package for shipment, that it contained the order book, and that it was necessary for the shipper to have the book in order to deliver the trees and shrubbery to his customers, it could not have contemplated that a failure to deliver the package within a reasonable time would result in a failure by the shipper to deliver any of the shrubbery, and its loss to him. There was nothing charging, or tending to show, that the delivering express company, or its alleged agent, the receiving company, had notice when the contract of shipment was made that the shipment included the order book, or was notified that the book was in any wise necessary to the sale, delivery, or any other use of the other freight. Therefore, as the delay in the delivery of the book was only three or four days, and it was not shown to have been injured, the owner was not entitled to recover more than nominal damages. And on these grounds above judgment was reversed.

Want of notice prior to, or at the time, the shipment was made, might, however, have been remedied, if the company had been notified, at destination, of the facts necessary to make it liable for damages in delay of delivery. If notice of the relation the book bore the other freight and the necessity for its prompt delivery was given at destination and then the company negligently failed to make such delivery it would be liable for special damages although it may have had no notice of the importance of the book and the necessity for its early delivery before it reached its destination.

It may also be noted that the court holds that before the express company to make delivery could be bound by the terms of the contract of the express com.

pany receiving the trees, shrubbery and book, it would be necessary to prove that the latter was its agent or partner, and any circumstance that tended to rebut such agency or partnership was admissible in evidence.

LA CROSSE, WIS.—Easter trade was never so good before as this year. On account of very unfavorable weather, owing to a total absence of sun during six days preceding Easter, supply was fair, but not much more than half equal to demand. Good roses sold for $1.50 a dozen, that is, Brides, Mermets, Wootons, Hostes and Bridesmaids, while Perles, Gontiers and Niphets were picked up clean at $1. Carnations brought 50 cents a dozen, with little regard for color, but good clear pink seems the most taking color here. Robert Craig and Tidal Wave appear to be good enough for the people of the Gateway city. Pot plants were a decided feature in this year's trade. Harrisiis, Soupert roses, cytisus, laburnum and Hydrangea Otaksa sold well. A handsome batch of lilies were seen from the Salzer Seed Co.'s greenhouses, brought in just in time, with an average of ten flowers and buds; needless to say they sold on sight at $1.50 each. The roses and carnations from that establishment also did credit to all concerned. Keenist & Son added another carnation house to their large range and are producing fine McGowans and Silver Sprays. Oak Grove Greenhouses also showed splendid azaleas and other stock.

DO YOU WANT a list of the leading cemetery superintendents? You will find such a list in our new trade directory and reference book.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

ORCHIDS SUITABLE FOR THE TRADE

The Leading kinds for cut flower purposes.

I. FORSTERMAN,
NEWTOWN, L. I., N. Y.

Washington.

I think it would be safe to say that the season is at least three weeks in advance. Among the shrubs and trees in full flower in the parks and reservations just now are the following:

Magnolia conspicua or Chinese white magnolia, one of the most beautiful of the Chinese varieties, a well known low tree, flowers pure white, appearing before the leaves; in the Botanic Garden are two fine specimens of this magnolia, each about 35 feet high, at present a mass of snow white, lily-like flowers and the most beautiful objects imaginable; this variety with us is frequently nipped by the frost before it comes to perfection.

Magnolia Soulangeana, Soulange's hybrid Chinese magnolia, a cross between M. conspicua and M. purpurea, is at its best just now; this is said to be the largest of the Chinese varieties; its low spreading head covered with white flowers with light purple at the base of the petals, is an object worth seeing.

Magnolia Halleana or stellata, a Japanese variety, in every way worthy of a place in every collection of shrubs; it is one of the first of the magnolias to come into flower; its flowers are almost pure white, about three inches in diameter and sweet scented; at present these plants in the Public Park are a perfect mass of flowers.

Cydonia Japonica, in three varieties, the red, light and dark pink, add much to the beauty of our parks. Then there are the very showy forsythias which are covered with their bright yellow flowers and are very attractive; Spiræa Thunbergii and S. prunifolia fl. pl. with their snowy white flowers add much to the beauty of the reservations at this season.

Prunus Pissardii has attracted considerable attention since it came into flower about a week ago; it is a mass of light pink flowers; unfortunately it only remains in flower for a short time, but is shortly followed by the foliage which when first put forth, is of a tender pinkish purple, changing gradually to a red-purple and finally to a rich shade of black purple, which it retains throughout the season; the hot sun does not affect its rich colors, but rather seems to add brilliancy; it is an excellent lawn plant. Thus far but few of the shrubs have suffered during the past winter, and all are showing signs of coming early into flower.

A plant of Dracæna fragrans some 20 feet or more in height, in the large conservatory at Botanic Garden, is in full flower, perfuming the entire house the past ten days. REYNOLDS.

NEW YORK

SOMETHING NEW.

Clematis Gen. Grant, or Crimson Jackmanii.

STRICTLY AN AMERICAN SEEDLING, and possessed of qualities not common to foreign grown sorts, namely extreme woodiness and vigor, flowers in racemes of great size, substance, and depth of color; color a maroon crimson changing to a deep purple in the old flowers, and lasting a long time, in several cases over a week in good condition after being cut. This variety will be highly prized when known, on account of its peculiar lasting qualities, and being so well adapted to our hot suns and dry atmosphere—practical florists will understand this.

Price, good plants, $1.00 Each; $9.00 per Dozen. Very strong plants, home-grown, $1.50 Each; $15.00 per Dozen.

P. S —Plants can be had of the undersigned, or of J. C. Vaughan, Chicago; or Phœnix Nursery Co., Bloomington, Ill.

Otaheite Oranges.

I notice your correspondent's inquiry, page 599, about Otaheite oranges. I have grown them rather extensively for the last few years, about 40,000 of them last season, and consider them one of the most interesting and desirable plants of the easiest culture for an amateur's collection. In fact they will grow where a geranium would and require no more care or attention; if anything, they will get along with less. I had a photograph taken last summer of a plant which was three years old, grown in an ordinary sitting room, with 25 fair sized oranges on it. The plant was not over 30 inches high.

I grow them from cuttings exclusively and find they grow as easy as a rose, and with proper care will bloom when 12 months old when not more than 10 or 12 inches high. This you see is much less trouble than grafting.

I was much interested in a report of a lady customer from Florida about a small plant of O. orange I had sent her by mail two years previous to her writing, when she told me in the rich Indian river bottom soil the plant had grown seven feet high and that big across, had a dozen good sized oranges the first year, and at the time of her writing was full of blossoms. She said it was anything but a dwarf. As a whole I have received more satisfactory comments from customers about this plant than anything else I have sent out. G. DROUSCH.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer, 114 Chambers street, New York. Next annual meeting second Tuesday in June, at Toronto, Ont.

SANTA CLARA onion seed growers report cold rain and poor outlook for onions planted on the lowest ground.

INJURIOUS INSECTS and the use of insecticides, is one of the many useful little manuals published by W. Atlee Burpee. It contains 185 illustrations of insect pests, and gives the most approved insecticides for each and every one. A very useful handbook for everyone interested in farm, garden or greenhouse.

Detroit.

Robert Watson, for many years foreman on Belle Isle Park, has embarked in business and will make the carnation his specialty. He has 3,500 feet of glass devoted to carnations and one house in course of construction, 80x18, will be devoted to sweet peas.

The central market has been abolished, compelling many to seek other quarters to dispose of their plants, etc. Some of the more enterprising florists have rented stores on our main thoroughfare. This move will have a tendency to improve the plant trade with florists. A great deal of second-class stock found an outlet in our central market.

Andrew Ferguson, wholesale grower, will erect an office and greenhouse on Woodward and Willis avenues as soon as arrangements can be made for next winter's trade.

New Catalogue (No. 4) containing over 1,000 Ornamental Cuts for Florist's use, such as envelopes, letter heads, bill-heads, cards, advers., floral designs, etc., at from 30c. and upwards. Price of Catalogue 25 cts. (deducted from $1 order).

HEALTHY CARNATION PLANTS Make Money for the Grower.

OUR CUSTOMERS ARE ALL COMMENDING OUR STOCK AND ENDORSING OUR SYSTEM OF GROWING.

This Photograph was taken in the Month of December and Represents our Daily Shipments.

See What They Say: Carnations are Certain to PAY when you Buy your Cuttings from THE COTTAGE GARDENS.

TESTIMONIALS.

SEAWANHAKA GREENHOUSES, W. L. Swan, Proprietor,
OYSTER BAY, L. I., January 25, 1894.

Last fall, to complete my stock for bench planting, I purchased of you a lot of carnations. It gives me pleasure to assure you that they were entirely satisfactory, and the *best* carnation plants I have ever purchased. It is a great blessing to Long Island florists to have near-by facilities for purchasing first-class stock such as your establishment is affording, and I hope you will be liberally patronized as you so well deserve. Wishing you the fullest measure of prosperity, I remain, Respectfully yours, W. L. SWAN.

WILKESBARRE, PA., January 24, 1894.

The carnations procured from you last fall were the healthiest and cleanest stock I ever saw. They have done excellently well. As I required these for stock, health and vigor, of course, was the great desideratum. In these days of rust, bacteria and all the ills which affect the carnation, it is a great pleasure to know where to procure stock free from these diseases.

Yours very truly, GEO. E. FANCOURT, Rose Grower.

TARRYTOWN-ON-HUDSON, January 25, 1894.

The carnations obtained from you last spring were obtained for sale and propagation purposes only. The plants were very satisfactory, being strong, healthy, well rooted cuttings, and we were very much pleased with them.

Very truly yours, F. R. PIERSON CO., Florists.

BUFFALO, N. Y., January, 1894.

I had from you last spring 500 Daybreak and 500 Wm. Scott carnations. I am glad to be able to say that the plants of both turned out remarkably fine, free from disease of all kinds. The bed of Wm. Scott has been loaded with buds and flowers from September 15th, and is finer to-day than ever and a sight that is good to dispel the blues.

Respectfully yours, WM. SCOTT, Florist.

1623 DORCHESTER AVENUE, DORCHESTER, MASS., Jan. 26, 1894.

The carnations that I bought of you last season were healthy, well rooted, true to name, and full count. The most satisfactory lot I have ever received from a commercial house. Wishing you all prosperity at your new place and awaiting your list of novelties, I remain,

Yours, etc, J. A. FOSTER, Florist.

BELLMORE, L. I., January 26, 1894.

The carnations purchased of you proved to be healthy and vigorous. They were very satisfactory. Your description of the merits of the new varieties was not overdrawn, thereby establishing our confidence in your stock for the future.

Yours respectfully,
R. P. JEFFREY & SON, Nurserymen and Florists.

SEA-SIDE GREENHOUSES, SOUTHAMPTON, N. Y, Jan. 25, 1894.

Please send your price list of rooted cuttings as soon as issued. Those we received from you last season were first-class in every respect and have done well. We wish particularly to say a good word for Wm. Scott and Mme. Diaz Albertini. Both are very fine.

Yours truly, HALSEY & EDWARDS.

Send for our Illustrated and Descriptive Catalogue, which gives in full our methods of growing and tells how we fight the rust.

THE COTTAGE GARDENS,
QUEENS, N. Y.

Baltimore.

The trade in cut flowers and flowering plants in this city was without precedent. Fine weather brought out everything, and the market men could not complain of the temperature, for a more perfect day could not be desired than Saturday in every respect.

Prices were perhaps a shade below last year, but the quantity of stuff disposed of was simply enormous.

There were many points of interest connected with the decorations and sales, but a scribe exhausted with loss of rest and hard work will be excused for briefly summarizing them. Messrs. Halliday Bros. had the best hydrangeas secn, Saml. Feast & Sons led the market with superb azaleas, Mrs. M. J. Thomas had the usual superbly arranged show window, Brackeuridge & Co. had their Easter sale at 110 N. Charles St., a big store crowded with bloom, Jas. Pentland, Jno. Cook and W. J. Halliday made their square a blaze of floral beauty.

The church decorations were fully equal to any ever seen here.

It is to be hoped that the ice is broken and hard times have finally disappeared.

MACK.

Correction.

In our last issue there was a typographical error in the article on the arrangement of flowers. In the fifth paragraph, third column of first page, the line, "It will close again at night," etc., should have appeared in the following paragraph, and apply to the tulips instead of the carnations.

Begonias.

	Per 100
Flowering varieties	$3 00

No list published and terms are cash with the order or C. O. D.

L. B. 496. **ALBERT M. HERR, LANCASTER, PA.**

WE REPEAT THAT THE NEW FANCY CARNATION "HELEN KELLER"

Is the most beautiful in form and prolific in bloom of any carnation that has been brought to our notice up to the present time.

We will read to you a letter under date of March 10. It is from the well-known W. Raymond, Esq., proprietor of the **Raymond Flower and Seed Store**, Boston, Mass., and also of the **Raymond Nurseries**, Pasadena, California.

"The box of Carnation blooms that you sent to me at Cambridge (Mass.), were duly received, and I find them so satisfactory, that I send herewith a check for $78, which with the $12 sent you recently will make $90.00, and you can change my recent order making it 1000 instead of 100. I thought that our carnations in California were as large as could be grown, but your **'HELEN KELLER'** beats them all." All of which is endorsed by those who have seen it **Growing** and **Blooming.**

PRICE FOR WELL ROOTED CUTTINGS:

$3.00 per dozen; $12.00 per 100; $25.00 per 250; $90.00 per 1000. 500 at 1000 rate.

ORDERS MAY BE SENT EITHER TO

EDWIN LONSDALE, *CHESTNUT HILL, PHILA.* or **JOHN N. MAY,** *SUMMIT, N. J.*

HARDY ORANGE (Citrus trifoliata).

The coming hedge plant, superior for the purpose to anything else yet offered.

Dropping of Rose Buds.

Rose growers complain of the buds of their roses dropping before they are full size. The stem below the bud becomes weak, the bud droops to one side, the stem turns brown and finally the bud falls away. With some sorts the buds are very small and drop quite early in their growth. No fungus was to be found in a mature form associated with these weak stems and buds; but when they were put in culture a gray mould (Botrytis vulgaris) came upon them. This mould is common to the greenhouse, appearing upon old blossoms of roses and other plants, and flourishes upon healthy leaves when the mouldy petals, etc., fall upon them. This is particularly true of geraniums and calla foliage. Whether the botrytis may be the cause of the dropping of the rose buds or only follows a weakness due to something else is not determined. The writer would like to hear from others upon this point through the FLORIST.

BYRON D. HALSTED.

New Brunswick, N. J.

LENOX, MASS.—A number of the leading gardeners in Lenox and vicinity having in view the encouragement and advancement of horticulture have organized the Lenox Horticultural Society. Although in existence less than two months the membership has already reached thirty-five, ten new names being added at the meeting on March 17th. Mr. E. J. Norman is president, and Mr. A. H. Wingett, Secretary. The meetings have been held at the office of Mr. J. F. Huss, gardener to Mr. George H. Morgan. At the March meeting a vote of thanks to Mr. Huss was passed expressing the indebtedness of the society to him for his zeal in its behalf and his kindness in giving them the use of his office. It is proposed to hold an exhibition in September, and schedule of premiums is in course of preparation.

Toronto.

The Gardeners and Florist's Association held its regular monthly meeting last Tuesday. It was well attended and extremely lively. A very clear and instructive paper was read by Mr. Geo. Price on "The cultivation of Mushrooms in winter and spring in cellars, etc. "The matter of suggesting judges to the societies holding the summer and fall shows was taken up and brought out lots of tall talk. Certainly the large majority of this association favor the single judge system and a change every year, the latter not because of doubts as to the integrity of any judge but in order to obtain the experience of different experts and to prevent sameness of style. There are however still a few who think three judges better than one. The trouble with three judges as one of the members remarked is that "one does not know who to kick" and that two duffers can overrule one man who does know his business.

Mr. W. Muston, of Messrs. Spears & Muston, brought down to the meeting some carnations Richmond and Albertini which one of the committee appointed to report on them said were the best he had ever seen. Some of the blooms of both sorts were fully 3½ inches over. The color of the Richmonds was especially bright and striking.

Trade has picked up considerably this week and at this date (Thursday, 22nd) the prospects are good for a big business being done the next two days with prices about as follows: Brides and Mermets $1 to $1.50, carnations (may be scarce) 40c. to 60c., lily of the valley 60c. to 75c., lilies 15c. per bloom, spiræa 50c. to $1 each, lilies (plants) 50c. to $2.50 per pot.

24th: Weather fair and cool, perhaps not quite fine enough to do the largest amount of business possible, but might be a great deal worse. E.

DETROIT, MICH.—The partnership heretofore existing between Frank Halznagle and John Noel, doing business under the firm name of Holznagle & Noel, at Highland Park, has been dissolved by mutual consent. The business will be continued by Frank Holznagle.

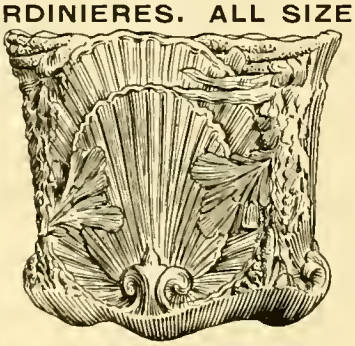
Directions for Using Fenster Pappe.

A SUBSTITUTE FOR GLASS.

Stretch **Fenster Pappe** taut and use batten in nailing on to sash. Then paint the rough surface thoroughly with boiled linseed oil until it shows a gloss. Let it become THOROUGHLY DRY before using, when it is claimed to do service for years. The application of the oil makes FENSTER PAPPE sufficiently translucent for plant life.



IT IS USED as a covering for cold pit sash; excellent for use in palm or fern houses; to grow strawberry plants, early vegetables, tobacco, etc.. under. A most handy article as a protection against the direct rays of the sun.

TRY a roll of eight yards as a sample, which will cover about four sash, for $1.00. Original rolls, 36 inches wide, 110 yards long, for $9.00.

Hartford, Conn.

The spring exhibition of flowering bulbs, March 22 and 23, was in many respects the finest exhibition ever given by the Hartford County Horticultural Society. Premiums to the amount of $175 were awarded to the exhibitors who won hearty praise on all sides for the skill and taste shown.

First premiums were awarded to A. N. Pierson, Cromwell, Conn., for 12 distinct named hyacinths, 6 ditto, 3 ditto, single specimen hyacinth, 6 pots of tulips with 5 bulbs in each, 3 pans of tulips with 10 bulbs in each, general display of spring bulbs, lily of the valley, tea roses, and H. P. roses; to John Coombs for 3 pans of hyacinths with 10 bulbs in each, and 3 pans of tulips with 25 bulbs in each; to Wm. B. May for Lilium Harrisii, begonias, and Deutzia gracilis; to Stephen Delbar for freesias, and cyclamens; to Geo. W. Atwood for ixias, Roman hyacinths, and Astilbe japonica; to James Smith for cinerarias, pansies, azaleas, and carnations; to G. Minge for primulas.

Chicago Cut Flower Exchange.

A special meeting of the board of directors was held yesterday (4th inst.) There being no quorum no formal action was taken. The members present discussed in an informal way a proposition to continue business at the old stand, and make an assessment of 50% on the stock, every member present being in its favor. It was finally decided to bring the matter up for final action at the next regular meeting of the board which will be held on Monday next.

NEWTON, MASS.—The Newton Horticultural Society is soliciting contributions from the citizens to aid in its work of removing the tent caterpillar from Newton. A good beginning was made last year and it is hoped that with constant vigilance the greater part of the annual loss from the ravages of this pest may be avoided.

PLEASE mention the AMERICAN FLORIST every time you write to an advertiser in these columns.

THE EASTER TRADE

Reports From all Sections.

The following reports were sent in response to these questions: Were the total sales (meaning the amount in money value and not in quantity of flowers, etc.) greater or less than last year, and if so, about what was the percentage of increase or decrease? How did retail prices obtained compare with those of last year? Was the supply of flowers, etc., equal to the demand? How did they compare with last year in quality? In view of the low wholesale prices did you buy more than in previous years, and if so was it all sold at a profit? Did you note any marked increase in the call for any special flower, etc.? Did you note any interesting peculiarity in the trade this year not covered in above questions?

NASHUA, N. H.—Easter trade here was the best noted within ten years of experience.

CLEVELAND, O.—No noticeable change in sales or prices. Roses scarce. Quality a little better.

ELGIN, ILL.—Gross sales and prices were each one-third less. Supply more than equal to the demand. Quality good.

ERIE, PA.—Small increase. Prices same as last year. Supply short. Quality better. Increased call for carnations and violets.

LAWRENCE, KAN.—Decrease of about 10%. Prices same as last year. Supply of roses short. Increased call for Harrisii lilies.

LOS ANGELES, CAL.—Increase of about 25%. Prices about same. Supply short. Quality superior. Larger sales of narcissus.

WILMINGTON, DEL.—Much larger. Prices averaged about same. Supply of cut flowers was short. Not enough hyacinths to meet the demand.

FT. WAYNE, IND.—Small increase. Prices lower. Supply short. Quality better. Increased call for roses, carnations, violets and Harrisii. Less call for bulbous stuff.

ELIZABETH, N. J.—About 10% less. Prices about the same. Supply equal to demand with exception of carnations. Quality superior. Increased call for carnations.

BLOOMINGTON, ILL.—No noticeable change in sales or prices, except on callas, which were lower. Supply equal to demand. Quality superior. Increased call for carnations.

EVANSVILLE, IND.—Increase of about 10%. No change in prices. Supply short, roses scarce. Quality not so good on account of previous hot weather. Roses went first, Harrisii second.

SALT LAKE CITY, UTAH.—A decrease and prices lower. Supply was equal to demand. Quality about same. What we bought was sold at a profit. Increased call for Bermudas and carnations.

NASHVILLE, TENN.—An increase of 25% in gross sales with prices 25% lower. Supply not quite equal to demand. Quality better in every way. Increased call for roses. Very few flowers shipped in.

TOLEDO, O.—About the same. Prices 10% lower. Bulb stuff was in excess of demand, roses scarce. Quality better. The cheaper flowers and plants were most in demand. Very few expensive plants sold.

TOPEKA, KANS.—Decrease of 25%. Prices about same. Supply ample except of roses and carnations. The weather turned cold and disagreeable on Saturday and we think that was the cause of the falling off in sales.

MEMPHIS, TENN.—Much larger. Prices were good as Easter was early and outside flowers were scarce. Supply short, roses being very scarce. Made a good profit on stock purchased. Carnations sold especially well.

SPRINGFIELD, MASS.—The Easter trade was larger than ever. The churches did not do much this year but the general public bought more extensively than heretofore. Carnations were the only flowers which ran short.

READING, PA.—A trifling decrease. Prices of roses were 25% lower. Supply equal to demand. Roses were not quite up to the mark in quality. Had a larger number of customers but the call was for cheaper grades of flowers.

HAMILTON, ONT.—Increase of 15 to 20%. Prices lower, Good supply. Quality excellent. Pot plants of good quality had the call. Better cash trade than we ever had before, credit being the exception instead of the rule as heretofore.

KANSAS CITY, MO.—Slight decrease and prices lower. Supply good. Quality superior. The cold weather hurt trade sadly. We were all prepared to do a big business but had to sell some stock at cost in order to come out even.

PAWTUCKET, R. I.—The trade for plants here at Easter is on the increase. This was noticeable in azaleas especially, which if in good condition sold at sight. Lilies and other potted plants also sold well. There was no demand for roses.

AUBURN, MAINE.—The heaviest demand here was for cut flowers, principally carnations. The only overstock was in lilies. There was less decorating and less demand for plants than usual and business compared with 1893 fell off about one-third.

YOUNGSTOWN, O.—Increase of about 15%. Retail prices about one-fourth lower. Supply was equal to demand. Quality first-class. Increased call for low priced flowers such as carnations, daffodils, etc. Sold more cut flowers this year than plants.

LYNN, MASS.—Larger and better prices. Shortage of flowers. Quality superior. Could not supply the demand. Increased call for lilies. Daybreak and Tidal Wave carnations sold at from $5 to $6 per 100. Jack roses, Mermets and Brides were in great demand.

DETROIT, MICH.—About the same and little change in prices. Supply ample. Quality somewhat better. Larger call for pot plants of good quality. With cut violets, roses, carnations and valley one could satisfy 90% of the demand. Bulbous stuff out of date.

RICHMOND, VA.—One-third larger. No change in prices. Supply good in everything but roses and violets. Quality better. Increased call for violets and Beauties. J. H. Harvey & Co. had a very large stock and rented two large stores for handling Easter sales.

CINCINNATI.—Easter trade in this city was all that could be wished for. The florists all seem to be satisfied. Prices were low, but I consider that a good thing for the reason that it enabled all classes to buy flowers, and it will create additional demand for same.

DANVERS, MASS.—Easter trade was larger than any previous season, notwithstanding the hard times. The call for candidum lilies as potted plants was larger than for either Harrisii or longiflorum. Carnations were in great demand and the supply early exhausted.

SAVANNAH, GA.—Nearly double on account of Easter being so early and few outside flowers to be had. Prices about the same. Supply equal to demand. Roses were better in quality owing to continuous clear weather. More memorial designs were ordered than usual.

SCRANTON, PA.—Increase of 10%. Cut flower prices were 25% higher but on plants were 10% lower. Supply of cut flowers was short but there was a large supply of plants. Quality good. Great call for violets. In the face of the hard times the demand was equal to last year or greater.

BUCKSPORT, ME.—Easter business was somewhat lighter than usual but this may have been due to a heavy snow storm on Friday. There was an increased demand for carnations over former years and the supply was short. Bulbous stock sold well. There was little church work.

UTICA, N. Y.—Increase of 25%. Prices averaged about the same. Short supply of roses and carnations. Quality good. In cut flowers there was an increased call for finer grades. Bulb stuff not much wanted. In potted plants there was a large demand for first-class azaleas, lilies, etc.

SYRACUSE, N. Y.—Increase of at least 25%, but prices were 25% lower. Supply of roses, carnations and violets was short. Quality excellent. Increased call for the three flowers noted above. The sale of potted plants was far in excess of previous years and all went at satisfactory prices.

HARRISBURG, PA.—Much larger. Prices about same. Supply not equal to demand. Quality better. All blooming plants sold well, especially hyacinths. The demand was much in excess of the supply. The weather was very fine and it seemed as though everybody wanted to buy flowers.

PORTLAND, MAINE.—The demand for loose cut flowers seems to have fallen off from last year and that for baskets and other set pieces increased, the willingness to pay good prices for good material being especially noticed. Lilies and roses sold out clean. Plants did not sell quite as well as was expected.

BRATTLEBORO, VT.—There was a larger demand than usual for plants. The demand for cut flowers was also good and although there was a large supply they sold out very clean. The principal call was for lilies, carnations, roses and violets. For hyacinths, tulips and narcissus the demand was only fair.

NEW ORLEANS, LA. Decrease of about 25%. Prices somewhat lower. Supply not quite so good on account of cloudy weather. Quality inferior. Increased call for lilies. Cut flowers were more in demand than made-up work. The building in which was the store of U. J. Virgin was destroyed by fire March 15.

TERRE HAUTE, IND.—Sales of cut flowers about same as last year. Prices also same. Supply short. Quality better. Increased call for roses and carnations. The cold wave on Saturday and Sunday killed the plant trade and hurt sales of flowers too. It was too cold to promenade and therefore no flowers were worn.

CROMWELL, CONN.—Easter trade was very satisfactory and everything sold well except hyacinths, and Dutch hyacinths especially were sold with difficulty. Roses, carnations, violets and lilies were in best demand and although there was a heavy stock available they were all cleaned out at usual Easter prices.

CAMDEN, N. J.—Increase of about 20%. Prices about same. Supply short. Quality impaired by absence of sun. Cut flowers and plants went with a cyclone rush earlier than usual. Sold largely of Harrisii lilies and could not get enough hyacinths. Good carnations were in great demand. Not so much call for daffodils.

ST. ALBANS, VT.—Easter trade was fully twenty-five per cent. better than in previous years. Potted plants of any kind that had blossoms were all sold out early and many more could have been disposed of. There was a heavy demand for fine cut roses, carnations and lilies. Roses were in short supply in this section.

HAVERHILL, MASS.—Easter trade was good in cut flowers. The supply of roses and carnations was a little short but lilies were abundant, and the prices being lower than ever before they sold readily and in fact every thing was well cleaned out. There was an increased demand for potted plants, especially for lilies and azaleas.

LOUISVILLE, KY.—Slight increase, with prices somewhat lower. Supply ample except of Beauties and violets. Quality not quite so good owing to extreme warm weather. More loose flowers and fewer designs were used. The churches were generally well decorated. One church used 1,000 lilies. The general run of orders were smaller than last year.

MILWAUKEE, WIS. — No noticeable change but prices were considerable lower. Shortage on carnations. Quality about equal. Bought more and sold out cleaner; being scarcely any waste profits were larger on same amount of gross sales. Anything pretty in way of a pot plant, costing not over $2, sold well. Still less made up work than ever before.

LOWELL, MASS.—An increased demand for potted plants was noted but a very small increase in flower sales, and churches bought less than formerly. Carnations had the first call. Lilies, roses, spiræa, heath, all sold in order as noted. Sales were in smaller lots but numerous and the result was quite satisfactory on the whole as stock was completely cleaned out.

WILLIMANTIC, CONN.—Easter trade was good and considering that there are now six retail stores in Willimantic where there were but two in previous years it would appear that Easter trade is decidedly on the increase. The heaviest demand was for cut flowers. There was a short supply of carnations in colors. Plants sold and rented about as well as usual.

ST. JOHNSBURY, VT.—Every year shows a steady increase in demand for Easter plants and flowers in this section and the present year was no exception to the rule. Lilies, in pots and cut, have been the most in demand for church decoration. Very few callas are called for. For presents potted plants in variety were popular and in cut flowers carnations seemed to have the preference.

PATERSON, N. J.—Cash receipts at least 30% larger. Prices fully up to last year. Supply large but everything sold. Quality fully up to the standard, carnations excellent. Bought with caution and sold at a profit. Demand for carnations greatly in excess of that of previous years. Most interesting feature was the great rush for flowers when everyone supposed that money for such purchases would be scarce.

NEW BEDFORD, MASS.—Easter trade was good as a whole; there was an increased demand for lilies, carnations and violets, carnations being in short supply and selling at 75c. to $1. Callas, tulips, stocks, spiræa, etc., went rather slow. Mermets and Bride roses brought $2 per dozen. There was a good call for blooming plants, this being especially true of Harrisii lilies, which proved to be in short supply.

MIDDLETOWN, CONN.—Flower trade for Easter was very good, in fact better than usual and stock was all sold out before closing up time. Roses, carnations, violets and lily of valley were the principal flowers called for. The demand for lilies and callas was not so good as it would otherwise have been if it had not been for the large quantity of lily blooms sent here from Bermuda.

PEORIA, ILL.—A decrease of one-half owing to the cold storm, dust and wind. Prices about same as last year. Supply was equal to demand. Quality better. There is a growing demand for extra well grown plants. The best always sell well at a high price. This was specially noticeable in lilies. Our market was flooded with inferior stock but all plants with large blooms and fine foliage met with ready sale. No call for smilax.

DES MOINES, IA.—About the same as last year; sold more flowers but prices were 25% lower. Short supply of roses and carnations. Quality better all round. Increased call for roses, carnations, violets and pot plants of Harrisii and azaleas. There were no very large orders, neither did customers want cheap flowers or complain about prices. The mass of

Scale
6 inches.

CARNATION RICHMOND AS SHOWN AT THE INDIANAPOLIS MEETING.

the less wealthy people wanted flowers, indicating an increasing taste for them.

DAVENPORT, IOWA.—About the same. Would have been an increase if the storm had not prevented. Some florists report a slight decrease. With some prices were about same as last year, with others lower. Supply was fully equal to demand. Quality superior. What was bought sold at a profit. The weather was against us. It began to blow cold Friday night and delivering lilies was hazardous work. Many were broken and had to be replaced.

MINNEAPOLIS, MINN.—About 20% larger. Prices a little lower. Supply fully equal to demand. Quality fully as good. Bought more and sold at small profit. Noticed an increased call for violets. Trade would have been a good deal better had it not been for the cold weather Saturday. There was a strong north wind, the thermometer was below zero and streets were rough. Delivering plants was difficult and a good many were frozen.

FALL RIVER, MASS.—Churches and stores did considerable Easter decorating. Lilies, both plants and cut blooms, were sold out early Saturday. There was an increased demand for azaleas in bloom. Spiræa and deutzia did not sell as well as usual. Potted tulips and hyacinths sold fairly well. There was an overstock of tulips and daffodils. Roses, carnations and violets were in short supply. Prices in general were lower than heretofore.

MONTREAL, CANADA.—About the same. All seem to be satisfied. No appreciable change in prices. Supply short. Good cut blooms were scarce, particularly violets and roses. Quality about as usual at the season. More home grown stock and less purchased outside than last year. Increased call for carnations. Some florists report smaller orders from the churches. Made up work is less in demand each year. Too many spiræas and too few Harrisiis.

NORWICH, CONN.—Easter trade was the best on record and the demand for lilies was immense. Lilies in pots sold well as did also small flowering plants generally. Hyacinths in pots were especial favorites, all colors selling well, but white in the lead. Everything in the way of lilies, roses, carnations and violets were sold out clean, first-rate prices being paid without question, a fact which the trade made no objection to after the hard times we have been experiencing.

BANGOR, MAINE.—Notwithstanding the very cold and snowy weather Easter trade was extra good, the best in fact for the past six years. Harrisii and longiflorum lilies in pots were sold in large numbers. Cyclamens, primroses and cinerarias all sold very well. Azaleas in small sizes went quickly but the larger ones somewhat slowly. Cut flower trade was good, there being a full supply of everything except carnations. There was no advance over regular prices.

ROCHESTER, N. Y.—Decrease of 20 to 25%. Prices a trifle lower on most flowers. Supply adequate except violets and carnations. With us wholesale prices were very little below those of last year so we did not buy as many. There is always a lot lost in handling and this cuts seriously into possible profits. Increased call for carnations. Rain all day Thursday and snow and wind on Friday made a difference in sales. Saturday was a good day but Sunday was cold and windy.

WATERBURY, CONN.—Easter trade here exceeded that of last year by fully one-fourth in quantity of flowers sold. Plant sales have steadily increased for Easter, keeping pace with the cut flower demand. Lily plant sales were unusually large. Prices were lower if anything than last year. Carnations sold at from three to four cents, roses from ten to twelve cents, Jacques from fifteen to eighteen cents and hybrids from thirty to thirty-five cents. Bulbous flowers went at every day figures, which are low.

BRIDGEPORT, CONN.—About the same. Carnations brought about same prices as last year but roses and bulb stuff about 25% lower. Supply was equal to demand. Forced stock was not quite so good as last year, carnations and roses were about as usual. Carnations and Jack roses had best call. There seemed to be an increased demand for flowering plants, lilies and azaleas being most in demand with hardly any call for hyacinths or tulips. In nearly every case the churches spent only half the amount of money expended in former years.

MARLBORO, MASS.—Easter trade was very good considering the times. The demand for lilies in pots was very heavy, but for cut blooms the call was light, the result of the large quantity of Bermuda lilies which were sent in here to our churches. While these came in fair condition, yet they were very short stemmed, but did very well for church decorating and prices obtainable for home grown blooms suffered on this account, and there is a feeling of resentment against the growers in Bermuda who serve the trade in such a manner.

GERMANTOWN, PA.—Easter trade, both in plants and flowers, was unusually large here. Prices were a little lower than last season, and on Saturday went all to pieces, especially on lilies. A number of new stores were opened on the main street and all did a good business, though there were quite a lot of plants left. Still the best were sold at satisfactory figures and all the growers seem satisfied. Cut flowers were in great demand and were rather scarce. Carnations, double tulips and valley were much sought, also handsome roses, good Brides in particular.

NEW LONDON, CONN.—Easter trade was rather ahead of last year. Flowers were plenty and stock was well sold out. The main rush was on small cheap lots of loose flowers, which showed a decided demand for flowers among the working people. There were few buyers for fine roses. Lilies in pots and low priced plants in general sold rapidly. Palms and lilies for church decoration went cheap. Many of the churches bought lily flowers from Bermuda. These came with short stems and in one instance a lady was overheard to say that the lot she received was all rotten; naturally she received but little sympathy from the florists here.

PITTSFIELD, MASS.—The demand here for lilies in pots was fully twenty-five per cent greater than last year. Other kinds of potted plants were in medium demand. Lilies cut on stalks were popular and roses sold well, especially Mermet and Brides which were to be had in first-class quality and brought $2 per dozen. The call for carnations was unusually heavy. They sold according to quality at from 50c. to 75c. per dozen; violets did not go as well as usual. Daffodils were in good demand at 75c. per dozen and general sale of cut flowers was about twenty-five per cent more than last year with an average decline in price of about ten per cent.

Chicago.

The supply of stock for the first half of the week was very limited, but trade being quiet at the same time no great trouble was experienced in filling orders. Towards the end of the week business became more brisk; Saturday was one of the busiest days this season, and everything was cleaned up, although stock the latter part of the week was quite abundant.

This week starts in with a heavy cut in roses; crops are on at a number of large establishments, which threatens to cause a glut unless business keep apace, but the prospect for a good spring trade appears to be bright.

In social circles there is quite a stir since the lenten season is over; a number of prominent weddings and other social gatherings are announced for the next two or three weeks. Monday opened up with an elaborate decoration for the annual banquet of the Iroquois Club at the Palmer House. This decoration was done by M. F. Gallagher, who is a member of this Club. It consisted entirely of wild smilax studded with roses for draping, with center pieces of roses for the tables.

Prices have dropped back again to their old level. Beauties come in a little more freely and are offered at 25 to 30 for selected stock; short stemmed go at 8 to 15. Hybrids are rather scarce yet, in fact there is less stock of this class of roses offered in our market this season than has been the case for a number of years. Nearly one half of the present supply is shipped in from outside points at that. The price rules firm at 25. Jacques are of good quality and fairly plentiful at 12 to 15. Of the larger teas the supply is heavy and of a quality that averages better than has been noted for some years at this season. Brides, while quite plentiful, meet with brisk demand, the price being held stiff at 5 to 6. La France has improved wonderfully and some extra fine stock is offered at 4 to 5. Mermets 3 to 4. Meteor is improving though a large proportion is still of poor quality; the best selected bring 6, seconds go at 4 to 5. Bridesmaid is offered in limited quantities at 6 to 7.

Carnations are very abundant, particularly colored sorts. Common varieties in red and pink go at $1; white is held 1.25 to 1.50, fancy at 2.

Harrisii, up to the end of last week, have been very short, but are coming in quite freely again; they go at 6 to 8.

Bulbous stock was pretty well cut out at Easter. Romans are noted in small supply, but the demand is very light. First quality goes at 2. Valley is in fair demand, good stock selling briskly at 2 to 3. Tulips are very slow at 2 to 3. Of Dutch hyacinths the supply is short, price 4 to 6. Daffs are very slow at 2 to 3.

Violets are getting very small and are fast nearing their end. The demand is quite brisk and stock of all grades is readily sold at 80 to 1.00. Mignonette is very plenty and of good quality; 2 to 2.50. Smilax is selling fairly well and as most of the stock has been cut out there is no such glut as has been noted most of this season, but prices remain so low that growers can see no profit in devoting house room to it. More attention will be given to Asparagus plumosus next season. The demand for this vine is steadily growing and large quantities were disposed of in our market, which with very few exceptions has been shipped in from eastern points.

A number of our large department stores have embarked in the sale of pot plants. The stuff that is handled by them is of the poorest and cheapest quality and the prices which are realized are probably all the plants are worth or more. A number of growers who supply these houses feel rather elated over the fact that by these means they are enabled to unload all the worthless rubbish that would find no sale in the regular channels of trade, but we are afraid it may prove a boomerang. These plants can not possibly give satisfaction, and buyers of them will hesitate before investing their money again, even if offered a sound article by the regular dealers.

The fakir is out again in full force and appears to do a thriving business. It is astonishing to note the amount of stock that is disposed of by them.

Mr. Robert Purvis, a member of the Chicago Florist Club, died at his home near Edgewater on Thursday last, from injuries received from a fall. Mr. Purvis was building a show house and salesroom in connection with his greenhouse, he was standing on a ladder not more than three feet from the ground, when the accident was caused by a miss-step, internal injuries received proving fatal. The remains were interred at Graceland cemetery Sunday last, members of the club attending. An appropriate floral design was sent by the club.

Almond Read died at the county hospital week before last. The deceased was employed by T. J. Corbrey at his west side establishment for 3 years and afterward acted as bookkeeper for Corbrey & McKellar at the exchange, where he gained many friends and was generally respected.

The result of the election Tuesday in North Chicago was a magnificent expression of resentment against the crowd that is attempting to make Lincoln Park a hospital for political hacks. Bartling pulled all his running mates down to defeat, and most significant of all received several thousand less votes than the rest of the ticket which he headed. Whether or not this expression by the people will have any effect on the governor remains to be seen. Park Commissioner R. A. Waller (president of the board) has returned to the city and announces that he will not resign in accordance with the governor's demand, and the entire press of the city loudly applauds the stand he has taken. Superintendent Pettigrew, acting on the advice of his friends, has not turned in his resignation, and it is barely possible that matters may yet come out all right.

Kennicott Bros. Co. have leased the entire second floor at 54 and 56 Randolph street for a term of years. The firm will occupy their present quarters as before. The Randolph street front of the floor is rented to J. B. Deamud & Co., now doing business at the Exchange. This firm will move into their new quarters about May 1.

Philadelphia.

The Easter trade is still the topic of conversation and all around, both grower and dealer express satisfaction with their business. Some dealers report not having done quite so much business as last year, but on account of more careful buying caused by the uncertainty as to the outcome, their profits were even larger, so they are correspondingly happy.

A number of weddings the past week have kept the boys moving, and as everything was cut so close for Easter, stock of all kinds has been very scarce; particularly has this been the case with carnations. All colors except red have been grabbed up on sight, and by night each day the dealers had sold out of this color, parties having to take Portia when they could get no other. Two dollars has been the low figure for even poor stock, medium to good flowers have brought 2.50 to 3, and some of the fancies 4 to 5, while the stately Helen Keller which seems now to be as fixed as the stars in price, brought 6. While most of the ordinary carnations seem to feel the effects of the warm weather, the fancies or new varieties appear to be better. Helen Keller, Sweetbrier, Ophelia and Daybreak, are now very fine, whether it is on account of the attention they receive in order to keep up their reputation, or whether it is due to their inherent good qualities, we will leave it to the buyers of this season's rooted cuttings to determine.

Roses have sold very well, and while prices have not advanced to any great extent all the stock has been sold at good figures. The larger class of teas have brought $6 to $8; smaller roses $3 to $4; Beauties $10 to $25; Laings and Luizets 15 to 25; Brunners from $25 to $40, most of the first-class stock bringing $4 per doz., although Anderson claims he gets $5 per doz. for all his No. one flowers. Colflesh has the Jacq. market to himself, they bring from $10 to $15 per 100. Smilax was very plentiful before Easter, and could be had for almost any price, this week however it is different, and 20 cents is asked for strings that will scarcely reach across the counter. A great deal of adiantum is now used, and this green sells readily at $1 per hundred. Daffodils are about done; what few there are, are quickly sold at $5. Sweet peas are coming in and with great difference in quality, mainly caused we should judge by lack of experience in cutting, as some have long stems with all the flowers open while others have but one flower open and a very short stem, the latter are also very soft. They sell well however, the poorest bringing $2 per hundred and 2.50 to 3 for the best.

Violets have been very scarce, the small single ones are all done, the hot weather bringing them on so fast that the week before Easter the foliage was almost hidden by the flowers, but by the latter part of the week they were done, and had all bloomed out. The double varieties are also scarce and what few there are seem but an apology for this popular flower. A few received from Virginia were really fine. It seems strange that violets can not be grown in Philadelphia successfully; flowers that come from the north, south, east and west, are invariably better than those produced about here. Here is a chance for some of our specialty growers.

The matter of rebuilding Horticultural Hall is now receiving attention from some of the wealthy members of the society. A committee having the matter in hand report that a movement is on foot that is likely to place the hall on the old site, in a greatly improved condition. Mr. Parson's contract with the trustees as superintendent of the Hall, or perhaps we should say ruins, expired the first of April. With the aforesaid gentleman himself however there is no danger of any dissolution; he is as lively as a cricket and seems like a horse kept in a stable for want of work, he has energy enough now to manage two halls.

The next chrysanthemum show is to be held in the Academy of Music and will be a grand affair, as the beautiful building will give the decorators a grand chance to spread themselves and show the citizens how beautiful the Academy can be made to look.

PHŒNIX CANARIENSIS ON A LAWN IN NEW ORLEANS.

The ten pin matches come off regularly every Thursday night. Last Thursday was an exception, however as the boys had enough to do without rolling ten pins. The match or series of games to determine who will be the committee to bring back the cup from Atlantic City next August, will soon be inaugurated and we have no doubt the team selected will be a strong one. K.

Mr. Harry Bayersdorfer of H. Bayersdorfer & Co. will sail on the 18th inst., on steamship New York for a business trip through England, France, Germany, Austria and Italy.

New York.

Business in the early part of the week was very good and the shortage of many varieties of flowers as noted at Easter continued for several days afterwards, but towards the latter part of the week stock became more plentiful and the demand seemed to slacken up considerably. There have been some large decorations which used up a great many flowers, and this naturally has had a beneficial effect upon the market in general.

American Beauties are very plentiful. The general quality is very good, but the large quantity that is coming in has had a depressing effect on prices, which have dropped lower than usual, although a few of the choice blooms will bring as high as $50 per hundred. Harrisii lilies are also abundant and the prices run from $6 per hundred down. White lilacs are being received by Thomas Young, Jr., in large quantity and the quality excels anything offered here this season. Carnations are the best stock in market at present and good prices are maintained on all varieties, the fancy sorts being especially in demand, and bring from $2 to $4 per hundred. Some of the finest Mermets and Brides that have come into the market this season are being cut by Mr. C. H. Hagert of Summit, N. J. Violets are quite abundant, while mignonette is excessively overstocked.

Contributions are being solicited for the benefit of the widow and children of the late Thomas L. Russell, and it is gratifying to note the response has been a liberal one.

Siebrecht & Wadley have filed a claim of $17,047.47 against the State for flowers furnished the New York State building at the World's Fair, the board of managers having refused to audit the bill.

Mr. Alfred Dimmock arrived from London per steamship Lucania on March 31st.

Phœnix Canariensis.

The accompanying engraving is from a photograph of a splendid specimen of this phœnix growing on the grounds of Mr. Simon Hernsheim, New Orleans. The photo was sent us by Mr. Justin St. Maud, the gardener in charge, who writes:

"The plant is considered the finest and largest in the United States. It covers an area of over 100 feet in circumference, is about 30 feet high and is 15 years old. It has stood the test of our lowest temperature (16°). It is now in full bearing and has thousands of ripe seeds."

New Haven, Conn.

Easter was with all the dealers the busiest day in flowers ever seen in New Haven. The demand far exceeded the supply in every article with the possible exception of yellow narcissus. Carnations, especially white and pink, tulips in light colors, violets of any variety (if only fresh), lily of the valley, roses in white and pink, were almost an unknown quantity late in the afternoon. The supply of scarlet carnations, bright tulips, and Jacq. and Wootton roses was almost equal to the demand. Lilies, both Harrisii and candidum, sold well, particularly the former in pots, the supply being perfectly exhausted. The demand for flowering plants was unusually large, anything in bloom being bought up readily. Mahernias, genistas, white and pink azaleas, heliotropes, geraniums, astilbe, potted hyacinths, and narcissus, were all readily sold.

The prices averaged about the same as last year, excepting Perle roses and lilies which were slightly lower in price. The growing demand each year seems to be for cheap flowers, as the Easter fashion here prevails with every class, and this season the advance in price of carnations,

and scarcity of such roses as Bon Silene and Safrano that could be retailed at 75 cents per dozen lost the dealers a large number of sales from a number of people who could not afford the higher priced stuff. The quality of the flowers grown here and sent in from outside, was never better, the past three weeks seeming to bring out everything and especially the bulbous varieties to great perfection. V.

Boston.

Trade has been good all along the line ever since Easter. The small remnant of stock left on hand in the way of lilies and white flowers after Easter found a ready market on the following day, and this demand was accentuated by the enormous quantity of flowers called for on the occasion of Harry M'Glennan's funeral. The number and beauty of the designs made for this purpose exceeded anything of the kind seen here in recent years and all the florists had a share of it.

Flowers have continued in great demand throughout the week. The stiff prices asked for carnations have begun to have an effect on the market, however, and there are indications that prices must moderate soon or somebody will have a stock left on hand. For fancy varieties fancy figures are willingly paid, but on common sorts of ordinary quality there is a disposition to protest. Roses of all kinds are selling well at fair prices.

Louis Guerineau has accepted a position as superintendent of the Botanical Garden which is to be established at Smith Academy, Northampton. Two new greenhouses have been erected on the grounds by Lord & Burnham.

Visiting Boston—J. Blaauw, Boskoop, Holland; W. A. Manda, E. O. Orpet.

Buffalo.

I have met no one in the business yet who was not well satisfied with the Easter business, some are very enthusiastic over it, others not quite so much. Altogether it is safe to say that the bulk of business done was far in advance of any previous Easter week. There were more to do the business, that must be taken into account. What a change the Easter business of to-day compared with fifteen years ago; not only in volume but in style. Then we were all looking out for church decorations and memorial designs. The latter is about obsolete and the churches decorate much less elaborately. If there was any feature of the trade more to be noted than another it was the sale of plants. Anything in the shape of plant in flower went. In quantity lilies took the lead, and sold at 20 to 25 cents per bud, either as a plant or cut. Next came azaleas, a large quantity of those were sold at from $2.50 to $7 and $8. It was quite noticeable that in azaleas the white did not sell anything like as well as the colored varieties. Old Mme. Vander Cruyssen with its grand shape and profusion of flowers will outsell any of them. There were good lilacs sold, but the demand for them was not brisk when the purchasers could get an azalea. A few of our florists invested in some monstrosities which they called standard lilacs, they were six or seven feet high with a little head of leaves and a few flowers on top. Nobody wanted them, but the owners have stored them away, hoping to find a market for them at our fall elections. Some of our ardent voters erect poles on that occasion. Spiræa, cineraria, pans of tulips, hyacinths and daffs all sold well. There are thousands of people who at Easter time want to purchase a plant, but their limited means won't allow them to purchase an azalea or even a dollar lily. They want some little plant for 25 cents and this should not be lost sight of. A Dutch hyacinth in a 4-inch pot or a nice zonal geranium in a 4-inch pot fills the bill. Of the former there was an immense quantity sold. There were no hydrangeas forced here, but Mr. Long got in a few and they sold, but you could easily over do that plant in this market. The Saturday preceding Easter was a fine fair day (for which we are all devoutly thankful) and some of the Main street stores overflowed to such an extent that they occupied the sidewalk for half a block.

It would be hard to say which was the leading flower of the day. In value of course roses took the lead, as is always the case. Carnations and violets ran a dead heat for second place, close up at the finish, showing no signs of distress as they needed little urging. There was no overstock of any of those popular flowers. Good tea roses sold at $2.50 per doz.; carnations, the best at 75 cents and $1 and violets at 2.50 per hundred. There was little demand for bulbous stuff, but nothing wasted, because very little was grown for the occasion. Lily of the valley and mignonette sold well. I never remember so light a demand for smilax; you scarcely heard it mentioned. Altogether the Easter just past must be considered the greatest floral festival this city—or for that matter this county—has ever witnessed, and we can look confidently forward that each succeeding Easter will be a greater event with the florist than any that are past. Hard times or prosperity—free trade or protection—won't affect it; rich and poor alike will buy a flower for Easter.

Time does not hang heavy on our hands now, for we have the pleasure of an interview with a Dutch bulb grower three or four times a day. Sometimes two of them at the same moment of time. They are easily disposed of this year, because they have had bitter experience before they get as far inland as this, and take a loud no as a matter of course, and with little protest. W. S.

The 12-year old daughter of Wm. Scott is dangerously sick with typhoid fever. The 21st day of the fever has passed with little change, but the family hope for the best.

St. Louis.

The cold snap that arrived here the day succeeding Easter, and noted in my last week's notes, was the most severe and destructive that has ever been known at this season of the year, that is taking into consideration the weather that preceded it. The glass registered on the nights of the 24th, 25th, and 26th, 17°, 16°, and 18°, and carried consternation to the heart of the fruit growers. Many of the market gardeners also were caught very severely with early planted stock; the damage however is not so irreparable with them, as they can replant their grounds. Considerable hustling was indulged in by florists having stock in frames to get them covered up, and the only available material being boards, manure having been dispensed with some time before, as a result of insufficient covering considerable damage was done, some firms placing the loss up in the hundreds.

The plant trade is slow, buyers apparently are waiting to make sure that spring has arrived before investing again in plants. Cut flowers still continue in good demand, the season has been noted for the number of "store openings" that have occurred since spring trade commenced, and which use up a great many flowers. They are mostly of a low grade, but still it keeps the market comparatively clean. A great quantity of wild smilax is used in these openings, and is most effective in the decorating, while at the same time it can be obtained at a reasonable figure.

At a meeting of the Exhibition committee it was decided to hold the coming fall show in the art rooms of the Exposition building, all the members present being of the opinion that the difference in the terms secured for these rooms, and what has been paid during the last two years for the Music Hall, would more than offset any disadvantages which might be urged against them. The premium list was gone over carefully, and changes that had been recommended were made, they consisted chiefly of cutting down the number of classes called for, and in more than doubling the prizes offered for plants, so that the growers can have the possibility of realizing something substantial for the time placed on specimens. Favorable answer were received from the street car lines regarding the advertising, and doubtless at the time it will prove most effectual. There will be placed in the statuary room of the Exposition building a fine display of fruit and other products of the state of Missouri, under the auspices of the Missouri Horticultural Society, for the coming annual Exposition. The display is intended to remain for several years and as the statuary room is one that will be turned over to the florists for the show, a special and attractive feature will be made of the permanent display.

At the recent Turner—Joy wedding the decorations at the church, and house, furnished by the Ayers Floral Co., were quite extensive and appropriate. The church was decorated throughout with palms and Easter lilies, while each side of the altar was banked with palms. Smilax was used for festooning, and a canopy studded with roses was composed of the same material. The house was decorated throughout, the mantels being banked with lilies and adiantum, while the fireplaces were filled with small palms and cut ferns. The chandeliers were trimmed with smilax and ribbon, the stair-case with smilax and asparagus studded with roses. All doors were furnished with portieres of smilax. The dinning room mantel was banked with adiantum and Mermet and Bride roses, the whole having a very charming effect. R. F. T.

Toronto.

Some of the florists report that their sales at Easter were a little less than last year and a few report larger sales, so that among the older established ones the total sales were on an average probably about the same, but it must be remembered that several new stores have started since last Easter and that two or three of these did a very large business and there is no manner of doubt but that the grand total of sales exceeded those of last year to a great extent; it is however almost impossible to do more than guess at the percentage of increase, which would not be instructive. But it is extremely doubtful if the money value of this grand total o

sales was much larger than that of last year on account of prices of nearly all stock being considerably lower.

The supply of flowers, which was immense, was with the exception of roses, violets and valley, equal to the demand. Carnations seem to have been quite cleaned up, many people taking them in place of roses, but there appears to have been enough. The call for carnations is increasing and in this city at least Daybreak still holds the lead.

The quality of the flowers may be said to be about the same as last year, as good as they are grown in this latitude, and that is saying a good deal.

As a general thing it is doubtful if retailers bought more than they did last year, probably owing to the fact that there were more stores to supply and that two of the largest wholesalers have retail stores and did a large business. This latter fact one might call the "interesting peculiarity" in the trade here this year.

The plant trade, which in the fore part of the week had been pretty lively and promised well, strange to say on the Saturday did not at all come up to expectations and of course there was much disappointment in consequence. The weather on Saturday was comparatively mild and did not interfere with the trade, but by Sunday evening there were 20° of frost, more like what Christmas ought to be. It is still cold (29th) and there is snow on the ground but we are promised that at the next turn of the tap it will be mild.

Considerable excitement has been caused in this country by the tariff revision, the cat is out of the bag now, but there is very little difference made in stock used by florists. E.

Washington.

Easter trade seems to have been fully up to the expectations of the majority of our florists. Thursday and Friday the weather was anything but favorable to flower buyers. The bulk of the orders came in at the last moment. Saturday was a busy day with all, many of them being compelled to remain in their stores from early Saturday morning until Sunday afternoon.

Good roses were very scarce, in fact poor ones were not plentiful. The warm weather during the past two weeks brought on premature growth, and threw the grower out of his reckoning; instead of having his largest crop at this time it was ten days past or more. Harrisiis were plentiful this season, the supply being slightly greater than the demand; they were sold for $3 per doz. Pots having from 2 to 4 flower stalks and from 5 to 8 flowers sold readily for $2. Azaleas and genistas in 6 and 7 inch pots were in demand; bringing from $1.50 to $2.00. There was a noticed falling off in the demand for hydrangea plants in flower, which is probably owing to their poor keeping qualities, the general complaint being that both hydrangeas and genistas lose their flowers shortly after being taken into the warm dry atmosphere of a dwelling house.

Violets were both poor and scarce; the demand was greater than the supply, this was probably due to the warm weather just past, which glutted the market for a time. Such as were offered brought $1 per 100. Carnations were not over plentiful and were in great demand. Bulbous stuff was very plentiful, and generally speaking good in quality, and was in great demand.

The majority of the florists had their windows handsomely decorated. Mr. J. R. Freeman had his beautiful store on 13th St. transformed into an exhibition room. He had a magnificent display in the large front window; the plants were nicely arranged from the floor to the ceiling, extending some 12 or 15 feet back into the store. It was a miscellaneous assortment of blooming plants and ferns, all in splendid condition. Among them I noticed three very handsome plants of Kalmia latifolia in full bloom; they suggested the question, will this plant become a candidate for Easter decorations? Mr. F. also had some very fine specimens of azaleas, some 4 or 5 feet high and the same distance through; they were a mass of bloom.

Mr. C. F. Hale had both his stores tastily decorated with hydrangeas, azaleas, genistas, Harrisii, palms, araucarias and ferns.

Messrs. J. H. Small & Sons had their large store profusely decorated with ivy and wild smilax plaques on the wall. They had a fine display of azaleas, hydrangeas, genistas, Harrisii, and other flowering plants. In their window fronting 14th St. they had an unusually fine display of hybrid roses arranged in jars, hid among adiantums and selaginellas, producing the effect of a rose-garden.

C. Strauss & Co. had a fine display in both their stores; hydrangeas, Harrisii, palms, ferns, callas, etc., together with their fine assortment of cut flowers, made a most attractive decoration.

Gude Bros. had an excellent display of Easter stock in general; their window was arranged to represent an egg-rolling scene, which was carried out very nicely in every detail.

Monday night we had 14° of frost, which did considerable damage to early vegetation, killing all the early peaches in this section I am afraid. The hyacinths in the parks which had just fairly started to make a show were all killed. Deutzia gracilis, which was finely budded, was destroyed, the entire young growth being killed back to the old wood. Spiræa suffered in a like manner. In unprotected places the young shoots of the hardy roses were killed. The various magnolias which were just in their height of beauty were as brown as cinnamon Tuesday morning. All of the early flowering shrubs were more or less injured.

REYNOLDS.

St. Paul, Minn.

The week before opened pleasant enough for the most fastidious but closed bad enough for the most indifferent. Friday was a fairly good day, but Saturday the thermometer sank nearly to zero and the wind blew a gale, making delivery of tall plants almost impossible.

The floral displays throughout the city were of the highest order. First and foremost was L. L. May & Co's. magnificent Easter floral opening in a large store on West 5th St. The store was filled to overflowing with lilies, azaleas, hyacinths, roses, etc. In the window a huge Easter cross eight feet in height made of lilies attracted and held the sight seers. It was very nicely designed and reflected much credit on the skill of Mrs. Garges, the competent designer for this progressive firm. They report sales good, ahead of last year with the weather very unfavorable. Their prices were fixed at 15 cents per bloom for lilies, hyacinths 15c. each, two for 25c. Their fine collection of hybrid roses in bloom sold readily at 50c to $1 per plant. Their stock was large and all sold.

Aug. S. Swanson also had a very fine display of lilies, azaleas and pelargoniums, these last being the finest plants ever displayed in the city. He occupied a store rented for the occasion on Robert St. His prices were rather higher than other florists, though his sales were large. We think however that he had quite a number of plants left on hand unsold.

Wm. King, on East Seventh St., reports good sales. Seeger & Heiersekorn, the popular Jackson St. florists, report good sales. Warrendale greenhouses made a fine display as usual. Chas. Bennett had the usual quantity of desirable plants and flowers, as did Charley Vogt in the Market House. E. F. Lemke had the finest lot of azaleas in the city and as usual made good sales. Chris Hansen was kept busy with his shipping orders and on the whole every one seems to have had a nice Easter trade, but they all begin their statements "If the weather had been favorable, etc." However as nearly all the stock in the city was sold what more could be wanted.

Prices on cut flowers ruled lower than usual. Roses sold at $1 to $1.50 per doz., Beauties at $3 to $4, violets at 50 cents per bunch, carnations 50 to 75 cts. per doz., valley $1 per doz., Romans, narcissus and tulips 75c. to $1 per doz.

The supply of cut flowers was nearly equal to the demand, but the cut was enormous for this season of the year. The greatest demand however was for cheap flowering plants; anything that would sell for 15 cents to 50 cents went quickly.

St. Paul certainly had the finest floral display ever seen here and the florists have had good Easter sales. There are several reasons for this. First the unusually large amount of stock planted in anticipation of Easter. Second the very light sales during the winter, consequently stock was not depleted as in former years. Third, the early date at which the Easter holiday season came. Fourth, the very warm and pleasant weather that prevailed for several weeks previous to Easter, bringing everything into bloom at the proper time. Fifth, the friendly rivalry existing between the leading florists, inciting them to greater efforts in producing, advertising and displaying their stock, and last but not least the desire created for plants and flowers the past year.

We notice spring stock looking well in nearly all of the houses about town. Sales after Easter are good and encouragement is felt all along the line.

FELIX.

Ottawa.

A long spell of beautiful weather was broken on Good Friday by snow and hail, accompanied by a frosty wind which lasted over Sunday, making it disagreeable for florists who had many plants to deliver. Lilies suffered most, owing to their length. Although there were not enough to supply the demand, all were glad when the last plant was delivered. Azaleas, spiræa, deutzia, pans of hyacinths, in fact anything in flower that could be sold for a dollar and under went lively, but foliage was not wanted.

The cut flower trade exceeded our expectations, owing probably to most of the M. P.s remaining in town, and the usual dose of funeral work came in at the busy time, making it awkward. There were no big orders for churches, most of the stock being contributed by individual members of the congregations, and after being manipulated by about twenty la-

dies of a committee the effect was nothing to boast of. St. Andrews (the Auld Kirk) was the only one that gave a straight order to decorate the platform with plants, being the first time this church has done so.

Trade has been a trifle flat since Sunday; roses especially are very plentiful. The mourning in the vice-regal household puts a damper on festivities, but Lady Aberdeer will start entertainments again on April 26 with a state dinner, when we hope to make up our losses to a certain extent. Lily of the valley throughout and violets for favors is the order for that occasion. It will be a relief when the one flower custom goes out. There will be a Drawing-room on the 28th, which will help all in the trade. Mrs. Speaker White starts regular weekly dinners this week; this lady is a very liberal patron of the florists, wanting the best only, and leaving the arrangement to the florist.

Good violets were scarce at Easter; one florist who has a house found himself short and ordered from Boston, to be shipped on Friday. The dealer, for reasons best known to himself, sent them on Thursday. When they arrived the wax paper was the best part of the shipment. The flowers had the appearance of having been used at a couple of parties and then stored for two days. The highest list price was charged, C. O. D.; 20% duty had to be paid—result, total loss.

ZERO.

Massachusetts Horticultural Society's Spring Exhibition.

The Spring Exhibition of the Massachusetts Horticultural Society, which closed on Friday evening, March 30th, was most creditable, considering the disadvantage of date and weather. A week directly after such an Easter as was experienced this year is not the most favorable time to get together a grand display. The worse drawback was the weather. Having come in like a lamb and maintained its lamblike manners until Easter had gone, March, true to tradition proceeded to assume the character of the proverbial lion, and worse days for the transportation of flowering plants than the first day of the show and the day immediately preceding could scarcely be imagined. The result was a smaller contribution than usual of azaleas and other large plants, so that when the upper hall had been well filled there was but a small remnant for the lower one. In many respects however, the show was a notable one, particularly in the bulbous classes, the hyacinths and tulips being uniformly fine throughout, and the cyclamens undoubtedly eclipsed anything ever shown in this country.

The principal exhibitors in spring flowering bulbs were N. T. Kidder, J. L. Gardner, Dr. C. G. Weld, W. S. Ewell & Son, the Bussey Institution, and E. S. Converse. In hyacinths, N. T. Kidder outstripped his competitors in most of the classes, although all were good, and it is not often that an opportunity is offered to see such well filled spikes of Lord Derby, Grand Maitre, King of the Blues, Alba Superbissima, La Grandeur, Gertrude and other old favorites. On tulips W. S. Ewell & Son and the Bussey Institution were well in the lead, Chrysolora, King of the Yellows, Brutus, Kaiser Kroon, Rose Grisdelin, Cardinal's Hat, La Reine and many more well known sorts being shown in best form. Lilies Harrisii and longiflorum, narcissi in variety, anemones, freesia, ixias, Roman hyacinths, grape hyacinths, tritonias, etc, were all shown in more or less quantity by the same exhibitors, the Bussey Institution and W. S. Ewell & Son winning first and second premiums respectively for general display.

The premiums for hard-wooded greenhouse plants brought out some fine specimens of interesting things which are seldom met with in exhibitions, such as Eriostemon intermedia, E. densifolia, Polygala Dalmatiana, Acacia armata, A. heterophylla, Boronia megastigma, Chorizema Lowii and some handsome ericas, in which class John L. Gardner and N. T. Kidder were the principal exhibitors.

Of hardy flowering deciduous and evergreen shrubs forced, the Bussey Institution and John L. Gardner contributed a fine collection. Indian azaleas were not up to past exhibits either in quantity or quality. The Lyman prizes for six specimens of these were taken by Dr. C. G. Weld and N. T. Kidder respectively, the Bussey Institution being first on four and W. S. Ewell & Son first on single specimen. The cinerarias were as usual brilliant in the extreme, John L. Gardner, Dr. C. G. Weld and E. S. Converse being the principal exhibitors.

The display of orchids was not large but there were some well-grown plants in all the groups, notably E. W. Gilmore's Oncidium Marshallianum and Cattleya Lawrenciana, J. L. Gardner's Dendrochilum glumaceum, Dendrobium Freemanii and Cattleya gigas Sanderiana, N. T. Kidder's Cypripedium villosum and Edward Butler's Dendrobium nobile, the latter receiving a special award for skillful culture.

Cyclamens were shown by Geo. M. Anderson and Dr. Weld. The table of twenty-four pots of cyclamens grown by Mr. Anderson was the great feature of the exhibition and attracted much enthusiastic admiration. The beautiful white variety Mount Blanc was particularly fine, the petals of the flowers measuring up to two and one-half inches in length. Another prime attraction was the display of Lace Plants (Ouvirandra fenestralis) from J. L. Gardner, E. S. Converse and J. S. Cowles, to whom the premiums were awarded in the order named. Rea Bros. made a fine display of Primula Sieboldi in many varieties.

The cut flower premiums were well competed for with the exception of those for roses. The prizes offered for roses amounted to about $200 and it was somewhat surprising that so few entries were made. J. P. Spaulding's Mermets and Brides and C. V. Whitten's Meteors and Hostes were very handsome. Among the best carnations shown were Nicholson and Ada Byron from Wm. Nicholson, Hector, Lizzie McGowan and Ferd. Mangold from E. S. Bridge, Henrietta Sargent from J. Tailby & Son, Jacqueminot from Peter Fisher & Co., Daybreak from L. H. Foster, Buttercup from C. Southworth and several varieties from F. A. Blake and Geo. Sanderson.

As usual D. Zirngiebel was invincible on pansies, his blooms sustaining well their reputation. James Comley arranged a pyramidal decoration consisting of a hemlock ten feet high beautifully festooned with wisteria and the base decorated with plants of cineraria, longiflorum lilies and asparagus.

Among the visitors to the show were W. A. Manda, South Orange, N. J.; Richard Gardner, Newport, R. I.; Geo. McWilliam, Whitinsville, Mass., and F. S. Folwell, Lenox, Mass.

Carnation Plants in Pots.

Last week I made a few remarks about exhibitions, treating on cut flowers only. There is another feature of exhibitions that is coming to the front and will I hope increase every year until it plays a prominent part in all the shows both spring and fall. This feature is the growing of and exhibiting carnation plants blooming in pots. In giving my ideas on this subject please remember that they are ideas only, as experience with this phase of carnation culture with me at least is yet to be attained. It would be very interesting to hear from some other growers on this subject.

First select a certain number of each variety that is wanted for this purpose and then take double that number to allow for failures. Pot them up and see that they are not allowed to become root bound, to dry or get checked in their growth in any way whatsoever. As soon as the weather permits, which is now in most localities, put them out into a cold frame and see that they have an abundance of air whenever it can be safely given them. Leave the sash off entirely as long as the weather is not actually freezing, and as soon as all danger from frost is over take the frame away. When you take the frame away if they can stand repotting put them into 4-inch pots and plunge the pots up over the rim in the soil. Have frames made to hold about four sash and so that you can set them aside in suitable weather and two men can carry them over the plants if one of those wet rainy spells of weather turns in that we so often have in the spring months. These wet spells of weather produce a very rank and luxuriant growth on carnations but not a very desirable growth, and plants wanted for exhibition purposes should not be allowed to attain a soft growth.

As a rule they will not require much watering, but it must be remembered that being in pots they will suffer from drouth quicker than if they were planted in the open field, and they should be carefully watched, and when ever they do need water give them a good soaking, as if you merely keep the surface nice and moist it will induce root growth around the top of the pot, which is to be avoided as much as possible. Care should also be taken that they do not root through the bottom of the pot.

When they need it, repot into fives and if necessary again into sixes or sevens. In topping them them the object should be to have a nice symmetrical plant by September 1st; one that will not need staking and will have at the date of the show a good crop of buds and bloom on it. In attaining this point of course you will have to understand the variety and handle it accordingly.

To get a good plant it is important that you do not crowd them; there should be at least a four inch air space all around each plant. It is hardly necessary to say that no weeds should be allowed among them. If you find that they are not coming up to the requirements exactly they can be fed up with a little liquid manure, but it is well to remember that this will somewhat retard the bloom.

CARNATION ADA BYRON.

Pot plants for exhibition will have to be grown by local growers, as it would hardly pay to have them expressed from any distance. Each grower should take a pride in helping make this feature of the show a success and if by any chance he makes a miss with his plants he should not stage them. A. M. HERR.

Carnation Ada Byron.

This carnation is a seedling from Mrs. Fisher, raised in 1891. This and the new carnation Nicholson were both from the same lot of seedlings, the originator being Sewall Fisher of Framingham, Mass. The Ada Byron is one of the most fragrant carnations known; it is of a robust growth and a good keeper; in color it resembles a well grown Grace Wilder. Both the Ada Byron and the Nicholson have been favored with a number of first-class premiums at various exhibitions in the east during the past two years.

WE HAVE RECEIVED from the Denver Floral Co. blooms of their new carnation James Huddart, which has never yet been exhibited. It is a large and well formed flower, in color a deep rich crimson, with an extremely rich velvety surface. It appears a promising variety.

Miscellaneous Seasonable Hints.

The very unusual date of Easter may have been too early to suit many growers of specialties, but it cannot be denied that an early Easter is very advantageous to the general retail grower. We have more ample time to get our spring stock in good shape, and lots of it which we should not have had if Easter occurred a month later, which it does once in a life time. The great bulk of the geraniums that have been waiting in 3-inch pots can now be shifted into 4-inch. Six or seven weeks growth in their increased pot room will just land them about right, looking fresh and well and full of flowers by the end of May, which in our latitude is the time of bedding out. Avoid any shading of any kind for your geraniums for a month to come. In fact they should never be shaded. If you can't afford to watch them and keep them well supplied with water, then plunge in some material above all of which is best spent hops. There is something in hops besides a medium to keep the pots from evaporation.

Now is the time to take the poinsettia from under the bench and after cutting back all growth that is decayed, shake out the old plants and start growing in a smaller pot in a night temperature of 60°. Cut back the last year's growth and make cuttings of two eyes. Put them in the propagating bed where you are keeping up the most heat and they will in a few weeks be rooted. But take care of the old plants, the offshoots of these old plants will readily root freely if treated like chrysanthemums in midsummer, with plenty of water, and if two inch plants in August will make the best of market plants at Christmas.

The late very warm weather in early part of March gave some of us a chance to sow sweet peas, but very few took advantage of the chance, and now at the first opportunity it is your duty to sow them. A very much nourished soil is not at all desirable for a crop of sweet peas. If the soil is too rich the plants will grow too much to "vine." If they are desired early which is always the case then a poor soil is what you want. I have been asked several times this spring if sweet peas should be soaked. They should not be; a better plan when the weather is dry after sowing them in the drill, which should be 5 or 6 inches deep, is to sprinkle the drills before covering the seeds, and after covering, firmly tread down the rows.

Hydrangeas will now have a chance to spread themselves. If you topdress them and pot them into 5 or 6-inch pots it is now certainly desirable that you should not have to shift them again. There is no plant that is such a gross feeder as the hydrangea, and the best way to supply their wants is by putting one or two inches of half rotten cow manure on the surface of the pots, and be sure and give them space enough to fully develop their fine foliage.

For several years I have adopted this plan: In a row of geraniums 100x3 feet, lift out every 4 or 5 feet 3 or 4 geraniums, and on an inverted 5-inch pot you can stand a hydrangea. Nothing sells better the latter end of May, so they deserve all the care and space you can give them.

The alternantheras that you have wintered over in boxes will now want to be potted off. If you don't have stock enough take off cuttings; they will root as easily as chickweed and remember there is only one place to make a good alternanthera, and that is in a mild hotbed. You can put A. paronychioides major in a house where the temperature is 80° at night and they will only exist, while a hotbed will produce full fledged and beautiful plants.

I have no right to trespass on other people's territory but I can't refrain from saying that one way of giving you more room in your houses will be by putting your young carnations out in a cold frame. There has been so much written about varieties, if not species, giving out lately, that it makes one stop and think. The abuse of the flowers we mostly depend on for a living is getting more and more difficult to depend on to return the expectant results. In carnations more than any other of our commercial plants is this true, and I believe that a *cold* frame, where the young plants can have a comparative rest for a few weeks, is of great benefit to them. Be sure and don't put them where heavy rains are likely to send water under their roots and on all fine days remove the sashes entirely.

W. S.

MORGANTOWN, W. VA.—A meeting will be held here April 5 and 6 to form a State Horticultural society. Mr. G. A. Hiehle, the florist of Parkersburg, is taking an active part in the work of organization.

CANTON, O.—Business has picked up in this locality during the last few weeks and all florists report that they have been able to sell at good prices everything they could present in bloom for Easter. Mr. Charles Brown is cutting some fine roses just now. La France, Perles and Meteors seem to be his favorites. He grows a large quantity of spiræa in 10 and 12 inch pots which he finds most profitable in his cut flower trade. Hyacinths sold well.

NEWARK, N. J.—The florist establishment of Karl Voight on Morris Ave. was visited by a burglar some time during the night of March 24th, who walked away with the safe in which $400 in money besides other valuables were locked up.

PROVIDENCE, R. I.—Mr. Joseph H. Brown, one of the founders of the Rhode Island Horticultural Society, an ex-president of that organization, and prominent in its councils, died on the 26th inst. in his sixty-eighth year.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

SITUATION WANTED—To take charge by a first-class florist, practical in all branches; age 32.
Box 2555, Fairmount Station, Phila., Pa.

SITUATION WANTED—By a German gardener, age 23, intelligent and reliable. Will commence any time. CHAS. DIERKING, Lehe, Germany.

SITUATION WANTED—By first-class assistant florist, 7 years' experience, references; central or east preferred. Address M, care Am. Florist.

SITUATION WANTED—By a German gardener, experienced in growing of roses, carnations and other stuff. R. HAUSCHILD, 329 Fifth Ave., Chicago.

SITUATION WANTED—By a young man 25, as greenhouse assistant, 4 years experience; good references as to character and reliability. Address ERNEST, care American Florist.

SITUATION WANTED—By florist, good hand as propagator and general grower; 10 years' experience; excellent reference.
C A, care American Florist, Chicago.

SITUATION WANTED — Commercial or private place, by young florist; 10 years' experience; speaks German and English; good references.
F L, care American Florist, Chicago.

SITUATION WANTED—By a practical florist, 13 years' experience in growing roses, carnations, palms and general stock; single. Good references. Address R G, 501 N. Calhoun St., Baltimore, Md.

SITUATION WANTED—As sexton or gardener by a first-class Scotch gardener; thoroughly understands all branches of the gardening trade; highest references. GARDENER, box 254, Westville, Conn.

SITUATION WANTED By practical rose grower and propagator, A1 in forcing roses for bloom, design work thoroughly reliable; a worker; steady place desired; first-class references. Address R, care American Florist.

SITUATION WANTED—As florist, 10 years' experience; for 3 years employed as rose grower and propagator in a large London nursery; excellent references. Apply to
ANDERSON, 116 Bloomfield St., Hoboken, N. J.

SITUATION WANTED—As foreman or gardener in commercial or private place; Scandinavian, married, 19 years experience; good references. Would prefer employment with a practical florist in the eastern states. State wages. Address
JOHN ROSE, box 61, Providence, R. I.

WANTED First-class specialist in hardy herbaceous plants for commercial nursery. Address PITCHER & MANDA, Short Hills, New Jersey.

WANTED—Good all-round vegetable gardener; must be of sober habits and reliable. Enquire OTTO HANSEN, 45 Lake St., in Cut Flower Exchange.

WANTED—An assistant in greenhouse. A good man will find good wages and share in profits, with regular employment, by applying to the
Prop. FLORAL CO., Ithaca, N. Y.

WANTED—Florist, experienced in growing cut flowers (especially roses and plants. Apply, stating experience and salary. COLIN SKINNER,
Davisville P. O., North Toronto, Canada

WANTED—To lease or buy, a young practical florist with $1,500 capital, would like to start in business within 25 miles of Boston. Address, with particulars C K, 116 Charles St., Boston, Mass.

It will pay every Florist who is interested in the

Violets Growing out of the Disease.

I saw a frame of violets the other day at a private place at Fort Washington, N. Y. City, that were without doubt the finest I ever saw. The plants were large, healthy and carrying the largest and heaviest crop of flowers imaginable. The flowers were large, fine color and without exaggeration you could pick them by the thousand. If a florist could flower them the same way and of as good a quality he could make a fortune in a short time. Now to speak of disease Mr. Webber, who grew them, says that last spring when he divided up the old plants for stock they were literally rotten with disease. He planted them out in the garden, and they got no more attention than keeping the ground clean and loose. When he took them up they were clean, healthy and as they are now in perfect health, and have bloomed continuously ever since. Mr. Webber does not believe in artificial heat for violets, and a look at his plants would convince anyone he is right. During the late warm weather he shades from the sun, so that his flowers are of fine substance and very dark color.

At another private place at Orange there is a frame of violets attached to the front of a greenhouse, and the plants and flowers are magnificent, so it goes to show that frame cultivation and no artificial heat, provided you can keep frost out, is the proper treatment for the violet. While I have seen some good violets in houses this winter I have seen none to compare with those in the above mentioned places. JAS. S. TAPLIN.

Hackensack, N. J.

FREDERICKS & HUGHES is the style of a new firm of landscape gardeners and contractors composed of Mr. Chas. H. Fredericks and Mr. John M. Hughes, the latter for the past eleven years superintendent of Wootton, Mr. Geo. W. Childs' country seat at Bryn Mawr, Pa. The headquarters of the new firm are at Bryn Mawr and Ardmore, Pa.

SUSSEX, N. B.—The Sussex *Weekly Record* of March 16 prints a lengthy description of the greenhouses of Mr. Herbert E. Goold, who starting in 4 years ago with a house containing 500 feet of glass, has since increased his surface to 3,500 feet of glass and uses 2½ acres of land in his business. Mr. Goold intends to build a forcing house for roses and an additional plant house the coming summer.

NEW BEDFORD, MASS.—Mr. H. V. Soule has completed a range of four greenhouses at 1325 Coffin Ave.

WHEN writing our advertisers please use one of your printed business letter heads or enclose your business card.

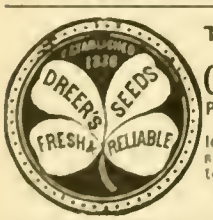
Foreign Notes.

A recent note in the *Journal of Horticulture* states that the black calla (Arum sanctum) is now in great demand for funeral flowers. The white callas are largely used for funeral wreaths and crosses, and a few of these dark blooms introduced among them created a demand. By the way, isn't this black calla remarkable for an extremely evil savor, something like the familiar skunk's cabbage of our swamps?

A fine introduction from Japan is the black bamboo, Phyllostachys nigra. The foliage is somewhat like Bambusa gracilis, with strong black stems. It should certainly be as hardy as B. Metake, and should be very useful in subtropical bedding.

In the *Kew Bulletin* Mr. George Nicholson speaks of the very extensive culture of roses under glass in America, giving some notes on the style of culture and varieties grown. Mr. Nicholson's remarks on horticulture in America will be found very interesting reading.

HARTFORD, CONN.—A plan which provides for the purchase of land and erection of greenhouses by the Hartford County Horticultural Society is being discussed and meets with considerable favor from the members. It is urged that the society could hold exhibitions of a high order under most favorable auspices if such an arrangement could be perfected.



KINGSTON, N. Y.—Mr. Geo. W. Van Gaasbeek has completed two new greenhouses at 112 Henry St.

SOMETHING NEW.

Clematis Gen. Grant, or Crimson Jackmanii.

STRICTLY AN AMERICAN SEEDLING, and possessed of qualities not common to foreign grown sorts, namely extreme woodiness and vigor, flowers in racemes of great size, substance, and depth of color; color a maroon crimson changing to a deep purple in the old flowers, and lasting a long time, in several cases over a week in good condition after being cut. This variety will be highly prized when known, on account of its peculiar lasting qualities, and being so well adapted to our hot suns and dry atmosphere—practical florists will understand this.

Price, good plants, $1.00 Each; $9.00 per Dozen. Very strong plants, home-grown, $1.50 Each; $15.00 per Dozen.

P. S —Plants can be had of the undersigned, or of J. C. Vaughan, Chicago; or Phœnix Nursery Co., Bloomington, Ill.

CLEMATIS.

ADDRESS **E. B. JENNINGS,**

WHOLESALE PANSY GROWER,

Lock Box 254. SOUTHPORT, CONN

Control of Ants.

Ants often become numerous enough in a greenhouse to be unwelcomed guests if not exceedingly troublesome. In our dwellings it is not so much what they eat that makes them such a nuisance as it is their presence wherever we go and in nearly everything we have to eat.

In the greenhouse they often push their galleries under the roots of plants, build their nests in the soil and become generally troublesome, but, if watched in their work for a short time, it will be found there is something that has attracted them to the place. Very often this is a colony of plant lice, or green fly, on some plant not far distant, and following an ant it will be seen running up to the lice and stroking them with its antennæ that they may give forth more freely a sweet secretion highly prized by the ants. Often there is a colony of similar lice working on the roots of some plant and because we see the ants running under ground around the roots and not the lice, we attribute the injury to the ants, which are there merely after this secretion.

If we can only find the nest of the troublesome ants, we can soon dispose of the colony. Usually the nest is in the soil, either in the greenhouse or just outside, and by making a small opening and pouring in a small quantity of kerosene, we can break up the colony. Better yet, a small amount of bisulphide of carbon may be poured in, the whole covered with a wet blanket for a few minutes and then the gas ignited after the blanket is removed. It is explosive and will drive the poisonous gas all through the lower chambers of the nest and kill the occupants. Some have tried putting paris green into the nest for ants to carry away and found it very satisfactory.

When the nests are somewhere in the frame work of the building, as the nests of the little red ant often are, it is much more difficult to reach the occupants. Catching them, as one might think of, with poisoned baits and traps is of little avail, as they breed about as fast as one could catch them by such means. If the wood containing their nest can be reached by removing a little of the floor or a board, kerosene poured over the place will then help. Pyrethrum will also aid much if persistently used, as ants are very susceptible to this powder.

I hope this may aid "A CONSTANT READER" in exterminating his troublesome pests. G. C. DAVIS.

J. T. DeWitt, Bristol, Pa.

Worcester, Mass.

Though the weather was rather dull and disagreeable Friday and Saturday our Easter trade greatly exceeded our expectations. All the florists that your correspondent visited said that they sold out everything they had and could have handled more stuff if it had been obtainable. The only firm that had to sell lilies at a sacrifice was a large drygoods concern who advertised lilies at 19 cents a bloom and were compelled to sell for 10 cents and less to get rid of their stock.

The quantity of lilies in the market was considerably greater than last year and we could have disposed of a great many more. Prices ran a little lower than in 1893, as trade hung off till the last minute.

We disposed of quantities of bulbous stuff, both cut and in pans, Von Sions and Dutch romans selling very readily at $1.50 a pan, though tulips went slower at $1.00. Tulips are played out here. Small plants of azaleas, genistas and ericas also sold well for fair prices. Carnations came in by the bushel, mostly first-class stuff, and brought slightly higher prices. Marie Louise and single Russian violets we had in larger quantities than ever but they sold out early for regular prices. The supply of roses was not nearly enough for the demand and what we did have brought good prices.

All of the leading churches had large decorations of palms and lilies, equal to those of last year, which was rather surprising because of the fact that they have spent a great deal of money on charitable work this winter and would naturally reduce their Easter orders.

Trade has been booming since Easter foreclosed the mortgage on Lent and "sassiety" is on earth again. Stock is a little scarce just now as we have not recovered from Easter shopping.

The Horticultural Society held their annual reunion last week and it was a very successful and enjoyable affair. At eight p. m. the members and guests sat down to the loaded banquet tables and after disposing of the tempting viands and listening to the remarks of prominent horticulturists of New England, adjourned to the large hall and indulged in dancing till an early hour. SEEDLING.

Couldn't Deceive Her.

A prim, but elderly lady, stopped in front of a florist's establishment yesterday, to secure some Easter lilies. Unfortunately for the customer, the last pot of this flower had just been sold. There were left, however, a number of flaring tulips of several attractive shades of crimson, yellow and purple. The florist, determined to make a sale, was equal to the emergency. He began a colloquy in this fraternizing way.

"Madam, I am extremely sorry that the old fashioned white varieties of lilies have all been sold, but here," (exhibiting the tulips) "are some of the latest and handsomest specimens of lilies from Japan. Of course you want to be in style this season, and I think half a dozen pots of the different colors would form a striking display for your window."

This did its work well, for the old lady with an unusually wise look said:

"Well, do tell! Everything has changed since I was a girl. I studied botany and all those high branches then, and know about it as much to-day as I ever did. So it's a good thing you didn't try to deceive me, for I could have instantly found you out."

The tulips were paid for and ordered to be sent home, and the old lady marched off with an air of triumphant wisdom.—*Daily Paper.*

Crude Oil for Fuel.

I read a note in the FLORIST some time ago on the advantages of crude oil for fuel. I would like to ask some of the experts in that line whether crude oil can be shipped to Mass., where coal is costing $7 a ton, and be burned to save money. Also where the best improved burners can be found. R. E. MOIR.

Boggs—"Do people buy fewer flowers during these hard times?" Florist—"No; but they pay fewer bills."—*Harper's Bazar.*

When you write to any of the advertisers in this paper please say that you saw the advertisement in the American Florist.

We all Know Her.

(Time—Easter Saturday at the busiest moment.)

Lady to Proprietor—"I'm so sorry you have no carnations."

Prop.—"Oh, yes, we have some."

Lady—(pointing severely at head clerk)—"Why, that man told me they were all sold. How much are they?"

Prop.—"Some 75 cents, some $1.00 a dozen."

Lady—"Will you show me some, please." (Proprietor shows some assorted colors) "Haven't you any white ones?"

Prop.—"Yes'm, plenty."

Lady—"Well, I won't mind, I don't want to pay over 50 cents for them."

Lady goes out, and head clerk winks at first assistant, while proprietor looks very weary.

"Ah, There!"

This had been a favorite expression with a little boy who died recently in a certain town not a thousand miles from Boston. Wishing to send something to the funeral which would be touching and appropriate his relatives ordered a floral pillow with the inscription "Ah, There!" and the same was duly made up and delivered.

Another affecting inscription on a design, said to have been sent to the funeral of a young man of combative proclivities was, "And he never struck his mother."

STANDARD FLOWER POTS

Every user of Flower Pots should correspond with us before purchasing elsewhere, our facilities are unequalled.

A. H. HEWS & CO., N. Cambridge, Mass.

Announcement to Florists.

We desire to announce the dissolution of the firm of Sipfle Dopffel & Co., and to introduce to the trade its successor, The Syracuse Pottery Co., which will be under the management of William Dopffel and Conrad Breitschwerth. The business will be conducted as heretofore, except on a larger scale to meet the growing demand for our goods. We have accordingly enlarged our plant and capacity, and with unsurpassed facilities are now prepared to fill the largest order on short notice. Our latest improved machines are turning out the best and most serviceable flower pots in the market, and assuring you of our intention to lead in further improvements we solicit a continuance of your patronage in the belief that we can supply just what is needed at a price and in a manner satisfactory to all.

Send for price list and samples and we know you will give us an order.

SYRACUSE POTTERY CO. OFFICE: 403 North Salina Street, SYRACUSE, N. Y.

STANDARD FLOWER POTS

Our new **Pottery**, new **Machinery**, the very **best Clay** in the **Country**, and our new **Patent Kilns**, all combined, make the **best Standard Pot in the market.** Send for price list.

PARMENTER MF'G COMPANY,
GEORGE MESSINGER, Manager. East Brookfield, Mass.

SPRINGFIELD, ILL.—Easter trade was about 10% less than last year. Cold weather shut off the trade to a great extent, particularly in plants. Prices were somewhat lower. Supply was ample. Roses, carnations and violets were pretty well sold out but there was a surplus of other stock. Quality good. Harrisii in pots or cut sold at as low as 10 cents per flower and bud counting all. Carnations sold at 40 cents a dozen and roses at $1 to $1.50 a dozen.

ALBANY, N. Y.—Easter trade was about the same as last year. Prices were a little lower on small cut flowers. Large Beauties, Jacqs, Brunners and other hybrids brought better prices and more were sold. Supply was ample except of carnations. Quality about the same as last year. Bought more and sold more at usual profits. Increased call for good Jacqs, Brunners and American Beauties. There was a large sale of plants. There was a great rush on Saturday though during the week preceding it had been slow.

Ornamental Horticulture at the World's Fair.

[*Extracts from paper read before the Mass. Hort. Society by Wm. J. Stewart.*]

In this connection ornamental horticulture may be considered, first, in its capacity as an indispensable feature of the equipment of the grounds and buildings; secondly, as illustrating the varied horticultural attractions, resources and industries of countries and States remote from each other, and widely differing in climate and topography; thirdly, as offering an opportunity for individuals and firms engaged in horticultural pursuits, all over the globe, to exhibit to the world in friendly competition the result of their labors. First comes the landscape work, as without the landscape architect in designing and locating and the gardener in adorning, those beautiful buildings would have lost much of their impressiveness. Our great landscape architect made the setting for those jewels, brought them into harmony and united them into one almost perfect whole; the requisite floral adornment would have made it perfect, especially the wooded island. The design was grand, and, being for the World's Fair, it should have been carried out to completion.

Horticultural Hall was ill-appointed and unsuited for the purpose it was supposed to serve; it should have been designed under the best horticultural advice obtainable. Practical horticulturists warned and entreated the management to give the horticultural section of the exhibition a full year's start ahead of the other departments; but at last they had only the immense building, with little to put in it. Their loud appeal for help brought a little from Massachusetts, but New York and Pennsylvania furnished the main part of the exhibit. After the exhibits were placed, the whole was desecrated by lemonade and knick-knack peddlers' stands. The bad judgment which allowed this merited the severest condemnation.

Of the displays made in the name of the various States, it must be confessed that few were worthy of a passing notice. The entire West did almost nothing. Illinois, which should have been first, was conspicuous for the absence of any respectable endeavor on her part. Outside of New York and Pennsylvania no worthy State exhibit was made. Between the States named there was a strong effort for supremacy. The character of their exhibits showed that, within their borders, horticulture has had a strong foothold for more than a generation, and their public spirited action is entitled to all praise. The same may be said of the showing made by Ontario. Still, the principle which ruled the selections for these exhibits was not the best. Suppose that instead of Japan's faithful representation of native gardening processes, Mexico's curious cacti, New Zealand's wonderful tree-ferns, and Holland's grand collective exhibit of hardy azaleas and rhododendrons, those countries had contributed merely a diversified exhibit of greenhouse plants; what a loss in interest and educational value the horticultural department would have suffered. Individuals engaged in the several departments of horticultural trade might be safely depended upon for displays of plants, tropical or otherwise; but States should have improved the opportunity to set forth their own native resources. For instance, what a noble display Massachusetts might have made with a naturally planted collection of her native flora, upon a bit of meadow, a rocky hillside, gay with many species of shrubs and wild flowers, from the first pussy willow and hepatica of springtime to the last purple aster of autumn. If you would learn whether the people are interested in such things, just look, any Saturday afternoon next summer, into that corner of this hall where the collections of wild flowers from the woods and fields are arranged, and observe the eager crowds who are admiring them. Let the display of roses, orchids and lilies be ever so gorgeous, that corner with its wild flowers will hold its own. In the old-fashioned garden connected with her State building at the fair, Massachusetts rose to the full height of her opportunity. As W. R. Smith of the Botanic Garden at Washington, truly said, "It was well conceived and elegantly carried out."

In considering the competitive displays in the different classes, the first point to notice is the provision made for this department. The buildings intended for these exhibits should have been constructed with direct reference to their future contents, but they were not. Had this been done we should not have seen rare, delicately reared tropical specimen plants being chilled to death in the room with hardy and half hardy plants. The exhibitors on the wooded island were well provided for during the continuance of spring weather. But when the summer heat came, the loose, porous soil of which this artificial land was constructed dried out rapidly, and no adequate supply of water being provided, the plants, especially the herbaceous class, soon failed; and this at the time of the greatest attendance of visitors. Nevertheless, this island was an attractive s[illegible] and through its influence the use [illegible]ly plants in gardening must have received a great impetus throughout the West. A few of the exhibits which were of superlative merit where Pitcher & Manda's display of decorative plants; the cannas from Dreer, Vaughan, Pierson and Craig; the cacti from Blanc; the rhododendrons from Moser and Waterer, the latter including a most instructive collection of seedlings, and the fancy caladiums from

Rio Janeiro. In general, the irises, pæonies, campanulas, poppies, pansies, azaleas and other outdoor displays on the wooded island in the early months were wonderfully fine. The opportunity given to the seedsmen for competitive exhibits of florists' flowers, including cyclamens, cinerarias, primroses and calceolarias, was improved to the fullest extent. It was sharply criticised at the time, but proved to be well worth all that it cost, for it attracted many thousands of visitors to the grounds before the fair proper was opened, and the exhibits were of the highest merit. They clearly demonstrated the marvellous results possible from close attention to the improvement of specialties. It is much to be regretted that of gladioli—millions of which are now exported from this country—the only exhibit of any extent was a foreign one; and the tuberoses, another important American product, were scarcely seen.

The extensive display of American horticultural implements and of American greenhouse construction, heating and ventilation was most creditable, considering the opportunities offered.

The system of judging and awards caused much dissatisfaction. The one-judge plan is un-American in principle, placing too much responsibility on one man to become popular. The interests of every competitor in an exhibition demand that the chances of an unfair verdict shall be minimized as much as possible. Against a decision reached after due deliberation by three experts, no protest can have any weight. This question of judging is of vital importance to every society; for unless exhibitors are convinced that every precaution has been taken to secure full justice, they will stay away. The Columbian medals are not likely to be valued so highly by their recipients as they might have been, had they been less freely awarded, or had they been so varied in design or value as to indicate degrees of merit. A medal for a rare and skilfully grown plant, or group of plants, loses most of its significance as soon as it becomes known that it differs in no respect from that given for a collection of wire designs, or a wreath of dried mosses. True, in the diplomas accompanying the medals, points of excellence in exhibits are carefully noted; but the diploma can never take the place of the medal as an award for which to strive. It is a question whether it would not have been better if the time-honored plan of gold, silver and bronze medals, to indicate degrees of superiority, had been adopted.

In conclusion it is pertinent to inquire whether that branch of American horticulture which has been considered is today any further advanced than it would have been had this great fair not taken place; and also whether we have taken full advantage of this grand opportunity to present our art in its proper light before millions of visitors. Horticulture's grand possibilities never recovered from the unseemly wrangle and delay at the start, and many of the unfortunate features to which attention has been called were directly traceable to this fact. It is gratifying to note the long step forward made by ornamental horticulture in the independent position secured for it as a separate department. In this it sought and obtained nothing more than its just recognition. While we may regret that much more was not accomplished, we should be grateful for what was achieved, not forgetting that mistakes are educators and serve the purposes of education as well as successes—provided we recognize and honestly acknowledge them as such—and that only in the future can the full results of the great exhibition be justly estimated.

The Arrangement of Flowers.

[Continuation of articles begun in our issue of March 22.]

SIMPLE BOUQUETS.

It requires more skill and practice to properly construct a bouquet than any other arrangement and here we find that natural good taste is indispensable to success. If you can arrange a high class bouquet you are warranted in laying claim to a high rank in your profession.

Bouquets may be divided into four classes: Hand bouquets, vase bouquets, corsage bouquets, and bouquets for funeral purposes. We shall treat them separately under the different headings as we progress.

For a beginning let us consider the bouquet in its simplest form, as a bunch for the hand or vase. Hand bouquets are generally made of but one variety of flower, such as roses, carnations, valley, Roman hyacinths, violets, etc. If the bouquet be made of different varieties of roses, be careful to select such as harmonize in color. Such varieties as Meteor or Wootton with Perles make a good combination, and if a third variety be added use Bride or Niphetos. Three shades like the above might be mixed together, as is often done, without injury to color effect, but we prefer to bunch the colors separately, taking care that the shades merge into one another gradually and that the dividing lines are not drawn too sharply. A combination of Brides and any of the pink varieties, such as Bridesmaid, La France and Mermet is good. Mme. Watteville and Bride is the best combination of all. Mme. Pierre Guillot and Perle harmonize well. Perle and Mme. Hoste with pink is not bad but not so good as the former. Avoid the mixing of pink varieties. Bridesmaid and Mermets are perhaps the only two pink varieties that form a harmonious color combination, and if arranged properly the blending of the two shades makes a good effect.

In the red varieties we find it just as difficult to blend the shades by using different sorts. Jacque and Meteor, if the shades be selected judiciously, might be bunched together without destroying the effect, but don't attempt to go further; it is far safer to confine ourselves to one variety.

But color effect is such a very important subject that we shall treat it separately later on. At present we will therefore confine ourselves merely to the arrangement of simple forms that do not require much study of this subject. Nevertheless we cannot ignore it entirely even in these forms, so let us start out by keeping in mind that if we arrange a bouquet of mixed flowers never bunch different shades of pink, or pink and red together, but place white or light shades of yellow between them.

The style and form of a hand bouquet will depend largely on the trade you cater to. In fashionable localities in our large cities there is little or no demand for the cheaper grade of bouquets, while in residence districts of the middle classes and country towns such bouquets are in great demand. Generally speaking the demand is for a loose arrangement, but frequently we meet with customers, mostly of European birth, who will insist upon the conventional European style of bouquet, a rather stiff arrangement, nearly flat on top, with either paper or lace holder.

Probably few florists in this country know how to make such a bouquet and we venture to say, will lose very little by never learning, although once in a while we meet with a member of the Bon Ton, who, having in a two months sojourn in Europe acquired continental habits and tastes, demands this style of bouquet. But as we said before a loose arrangement is generally preferred, and certainly should be recommended.

Our first illustration shows the top view of a bunch of two dozen roses with their own foliage and Adiantum cuneatum, in shape slightly rounded over the top, the flowers set nearly even in height, although the arrangement might be varied by raising some of the blooms above the rest. If you do this set the larger roses low and raise the smaller buds. If the roses are borne on strong and stiff stems no wire will be required but if weak use a No. 24 or No. 26 wire (see article on stemming). You will find it useful in holding the flowers in the desired position.

If more than one variety of flowers be used select such as will form a suitable combination. Roses and lily of the valley, or roses and Roman hyacinths go well together. Mignonette can be used with good effect. Tulips, daffodils, Dutch hyacinths and flowers of that nature are undesirable and seldom used for the purpose. Carnations, either for the hand or vase, are best by themselves.

Our second illustration shows a bunch of two dozen Portia carnations arranged for the hand, and may serve equally well for the vase. The carnation is a rather stiff flower and difficult to arrange in a graceful form. Some varieties are better adapted to this purpose than others. Portia and Lizzie McGowan are two of the best. In many of our best sorts the stems are so stiff that great care must be taken to avoid having them pack too closely together. We often find it necessary to employ the use of wire, though the stem be fully long enough, and for an entirely different reason than that applied to the rose. By using the wire on the stem we are enabled to bend it in the position required without running the risk of breaking it, and if done properly the wire will not show in the least. Don't run the wire up close to the flower, but twist it around the stems, taking two or three flowers together, three or four inches below the flowers. If arranged for the hand we may add a few fronds of adiantum. For a vase, if there be plenty of buds on the flower stems, we seldom employ any other foliage. If a few sprays of their own foliage can be had it will serve us better than anything else we can find, but unfortunately this is not always obtainable.

Our third illustration shows an arrangement of mixed flowers for a vase. In a bouquet of this kind we may use almost every variety of flower with stem long enough to reach the water. The more careless and natural such a bunch is arranged the better will be the effect. Use plenty of green. You will have a stock of the evergreen wood fern on hand; these are inexpensive and very useful for your purpose. In fact almost any kind of foliage, providing it be not too coarse, if the bouquet be small, can be used with good advantage.

The bouquet of mixed flowers we illustrate was made of a common grade of the following flowers: 3 tulips (Kniserkroon), 9 Narcissus poeticus, 5 La France roses, 2 Brides, 1 Am. Beauty, 2 spikes of Dutch hyacinths, 8 Romans, about one dozen pieces of mignonette, one-half dozen adiantum fronds and 2 dozen common wood ferns. The amount of material, as will be seen, is very small.

TOP VIEW OF BUNCH OF TWO DOZEN ROSES.

ARRANGEMENT OF FLOWERS.

Now let us proceed to make the best possible effect with this limited amount of stock. Although the stems are all of sufficient length, still we find it advantageous sometimes to use wire, as by this means we are enabled to bend the stems and keep them in proper position to better advantage. This wire, as has been stated before, will not injure the keeping qualities of stock in the least and need not be made noticeable at all in the arrangement. The wiring of roses has been described before. Wire the narcissus the same as carnations for a bouquet, by taking 2 or 3 flowers together and run the wire down the stems 3 or 4 inches below the flowers. Handle Romans the same, but as the stems of this flower are very brittle we have to be careful. Don't use a heavier grade of wire than No. 26. The tulips, mignonette and greens we don't wire.

We commence of course with the top flowers, the tulips in this case, using white spool cotton No. 10 for tying. Start tying low down on the stems of the flowers if you wish your bouquet to be loose and graceful. Place the narcissus next. The stems being wired, you can now bend them just as you want to. Keep wrapping the thread around the stems as you proceed so as to keep the flowers in shape, not forgetting to intersperse the green, and don't be sparing of it; wood ferns cost but 5 cents a bunch of 25 and if properly used save a dollar's worth of flowers. Leave the heavier roses for the body of your bouquet. Arrange the flowers at the finish in such a way that they will droop over the rim when placed in a vase.

If the bouquet is to be placed on the mantel or in any other position where a front or side view only is desired we should so arrange the flowers as to show to the best advantage in such a position. Our illustration is taken from a bunch arranged for such a purpose. If on the other hand the flowers be placed on the table, where they can be viewed from all sides, finish the bouquet alike all around.

We shall treat of the more elaborate forms of bouquets in their various styles in a series of articles later on. Our next subject will be the arrangement of simple and inexpensive baskets.

Miscellaneous Seasonable Hints.

Just as soon as the ground is in working order plant some gladiolus. We are told to plant at intervals during the summer, which is all right, but let the first planting be about half your crop. They don't flower all at once. The cutting from the first crop will last 6 or 7 weeks. Gladiolus deserve and should have the deepest and richest piece of ground you have.

If you wintered over any young hollyhocks, which you should have done, plant out for yourself at once. I have had the greatest success with these stately flowers in a heavy soil with a liberal lot of manure added. You need not manure the whole ground, but in each hole prepared for the plant, which should be one foot deep and two feet wide; let one-third be cow manure. Really fine spikes of hollyhocks are rarely seen as they were 20 years ago. They will sell well for many purposes and be a grand flower for your store window in summer when other flowers are scarce.

If you have a demand for or want to increase your stock of that most useful plant, Helianthus nanus, fl. pl., don't fail to at once dig up the old roots and divide. The smallest piece showing life, if put into a 4-inch pot, will make a satisfactory plant for selling in a few weeks. There are very few garden plants more satisfactory in the now popular mixed garden than this continuous flowering little sunflower.

If you had occasion to sow any perennials or biennials last fall, such as Coreopsis lanceolata, Delphinium formosum, Dianthus barbatus (Sweet William) and others which are so useful for summer flowers, don't delay in getting them planted where they are to flower at once or as soon as the ground is dry. They should have been wintered in a cold frame and a little frost won't hurt them at all. If you had no time to move or divide your herbaceous plants last autumn and you have occasion to do it, it can be done now just as well before there is any start in the growth. Such useful plants as the herbaceous phlox, pæonies, pyrethrums, etc., can be moved and divided now without any injury to this season's flowering, if done with care.

There is yet time to propagate a few of the leading plants. With us coleus sells until almost the 1st of July. There are sure to be some parties who don't have their new grounds ready before that time. A large batch should now be put in and will still make good 3-inch bedding plants by the first of June. The same with achyranthus, although it is a much slower grower.

Don't forget to propagate about now your winter flowering begonias of several kinds. I find they root rather better now than in February.

It's a good time to take the runners off the violets for next winter's crop. Some put them in sand as you do ordinary cuttings, but this is scarcely necessary, as you have now such fine runners to choose from they can be put in 2 inch pots at once or in flats of earth and potted off in a month's time.

Don't let the young asters, phlox and other annuals sown last month get too "leggy" in the seed box. If you have a quantity you can transplant into cold frames two inches apart. If that is not convenient flats with two or three inches of soil are just as well and place them in cold frame. Be sure that the roots are firmly planted, not at the neck so much as around the roots, and let the little plant go down in the earth to its seed leaves. When you have benches to spare in cool houses instead of cold frames, use them, but you should not have any benches for such a purpose at this crowded time, and there is such an abundance of light and air about a frame that these hardy seedlings do altogether better in them.

The bright sun pouring down on us now will cause much extra labor in watering and injury too if you don't shade. If possible get your stock so arranged that in one house or one portion of it you can have all those plants that don't need shading and in another those that do. The very great majority of plants, both hard and soft wooded, are not hurt by a little shade if you don't stop firing too soon. I have tried several mixtures for a permanent summer shade, and the best of all is naptha and white lead; be sure to have no oil in it unless you want a scrubbing bee in the fall. You can make the wash as thin or thick as desired and ap-

ply with a whitewash brush, then you will have it done properly. This takes much longer than syringing it on, but what of that? As Mr. M. A. Hunt says, "labor is cheap; it's brains that come high." WM. SCOTT.

Orchid Notes.

CATTLEYA LAWRENCEANA.

This magnificent cattleya although first discovered about fifty years ago, was not known to cultivators until rediscovered and introduced by F. Sander & Co. about ten years ago. It was at once assigned a prominent place among cattleyas. After the many varieties of C. Trianæ have vied with each other to keep the orchid house gay and have passed away until another season, then Cattleya Lawrenceana comes into bloom, developing spikes of five, six or seven flowers of beautiful rosy purple. The blooms average about five inches across and last a long time in perfection. It is indeed a valuable addition and cannot be too strongly recommended.

It is a very distinct, likewise a very variable species. The most distinct variations I have seen are C. L. rosea superba, C. L. concolor and C. L. Macfarlanei. The variety rosea superba has flowers larger than the type, of a very delicate rosy purple faintly striped with white; the sepals much paler than the petals, and labellum which has a whitish disc. The variety concolor has flowers of a uniform pale rose color of good substance and form. The variety Macfarlanei, which is more robust in habit, larger in all its parts, a full flower pale rosy purple at the base of sepals and petals, the remainder of sepals, petals and lip of the richest and deepest purple, is a superb and striking variety, named in compliment to Mr. Macfarlane, the artist.

This plant is of comparatively easy culture, doing well in baskets kept well up to the light, requiring plenty of moisture during the growing period. It has recently been largely imported, consequently is within the reach of everybody, and being of easy culture it should not be overlooked by any who desire a valuable addition in their orchid department.

CYMBIDIUM GIGANTEUM.

This fine cymbidium is a native of India. It is of very striking appearance, pseudobulbs five to six inches long, with long arching deep green foliage over two feet in length, flowering on long racemes of ten to twelve flowers, each three to four inches across. Sepals and petals are of bronzy green striped longitudinally with dull red, lip oblong, three lobed, side lobes colored like sepals and petals, middle lobe yellow spotted with red.

This plant is of easy culture, flowering in December and January. This makes it extremely valuable as a decorative plant. It will thrive in an ordinary greenhouse and will amply repay any extra attention bestowed upon it. It loves a cool temperature and while growing should be abundantly supplied with water.

CYMBIDIUM LOWIANUM.

This is a plant of more recent introduction than giganteum, being introduced by Low & Co. in 1877. It created quite a sensation when first exhibited in 1879, also in 1880 when first flowered in America. It commanded very high prices until its reintroduction by Low & Co. about 1886. As a horticultural plant it is without doubt superior to giganteum, which in general appearance it most resembles. Although the flowers are not so large and varied, yet the much longer and more arching and graceful spikes and the brighter colored flowers which last much longer in perfection, give it an especial value. It flowers in March, April and May. I have seen twenty seven blooms on a spike, which has lasted about three months in perfection. The flowers are three to four inches across, sepals and petals greenish yellow with faint reddish veins, lip three lobed, the side lobes roundish oblong, light buff and the middle lobe reflexed and covered with velvety pubescence, dark red crimson margined yellow.

There is a form with sepals and petals bronze yellow, with a much richer labellum. Also a form which appeared three years ago, which is named C. Lowianum concolor and has for a synonym C. Mandianum. It is very distinct, of good form; the sepals and petals are greenish yellow, the upper portion of lip a bright buff yellow, the remaining surface of lip light yellow; all traces of crimson are absent. It is a valuable acquisition. Like its allies it is of easy culture and makes a fine decorative or exhibition plant. The flowers last long in perfection and become more and more beautiful with age.

North Easton, Mass. WM. ROBINSON.

Orchids at Orange, N. J.

For one interested in cypripediums (and who is not) there is no more attractive spot to visit than the greenhouses of Henry Graves, Esq., at Orange, N. J. Here are to be seen the almost incredible number of seven hundred species and varieties of cypripediums, besides lælias, cattleyas and many other orchids in extensive variety. Cypripedium Chamberlainianum is represented by about seventy plants among which are several distinct forms. One plant of this species has been constantly in bloom since July 10, 1892, although bearing seed at the same time. There is quite a show of Cattleya Schrœderæ at present and Lælia purpurata will soon be in bloom, in large numbers. Mr. R. M. Grey, the gardener in charge, is an enthusiast on orchids, cypripediums being his particular favorites, and of these he has raised many beautiful hybrids. An experiment which he is now trying is to plant cypripediums in pebbles instead of moss. So far they seem to thrive well under the new conditions and many of the objectionable features of the old method are avoided.

Carnation Notes.

What has Easter taught us? One thing assuredly and that is that the demand for fine well grown carnations is decidedly on the increase and that secondary stock is no longer to be thought of by the wise grower. Easter has in a great measure been a repetition of Christmas with the difference of everybody seemingly being satisfied one with another. This is as it should be; the relations between the grower and the retailer should be of the pleasantest kind. The grower should be careful to furnish only good stock and the retailer should be willing to pay a fair price for the same. There should be considerable difference in price between a good flower and a secondary one, considerable more than there is at the present time. A flower that will bring $2.00 per dozen should bring the grower not less than $8.00 per 100, and the flower that brings but 25 cts. per dozen should not be worth to the grower anything over $1.00 per 100. There are of course times when a good flower will sell for less than its real value but taking their actual value in an ordinary market the above would be a fair ratio. At Christmas and Easter when the flowers that usually would bring 25 cts. are raised by the retailer to 75 cts. he should not object to paying the grower $3.00 per 100 for them. Taking the season through I don't think the growers have such a delightful time of it and as far as I can learn they are not becoming millionaires very fast.

There are no doubt many little points we think of now where we could have bettered our crop for Easter and it will be well to make a memorandum of them for reference. Personally I found the express companies in a sort of miniature Christmas panic. Instead of getting my flowers into St. Louis on time they arrived one day late and I have made a large entry in my memoranda that it is best to get one train ahead of time for Easter as well as for Christmas.

One party ordered a lot sent C. O. D. and then refused to take them; they were too far from home to have them sent back and he no doubt secured them for little or nothing. This is an old scheme but there are always some, like myself, who are a little too confiding, and it would be better all around if the C. O. D. business were abolished entirely. If a man has the money to pay the C. O. D. he has it to send in advance and if every grower would refuse to send such perishable articles as cut flowers C. O. D. it would make a healthier trade.

There seemed to be a superabundance of red in some sections. If you have had too many of any one color it will be well to call a halt now in arranging for next season. If any variety has not paid you, do the same. It is far better to throw them out now than to grow them all summer and next winter and wish they were out then. If you know of a variety that will pay you better than what you are now growing do not hesitate to buy it, for it is penny-wise and pound foolish to grow an inferior sort because you have it in stock or can buy it cheap.

A. M. HERR.

Acacias.

These handsome and useful Australian plants seem to have been neglected to a great extent in this country, but are now beginning to be appreciated both for decorative purposes and for cut flowers. They flower just at the time they are most needed, that is in the latter part of the winter, from January till May. They stand decorating well, and last for quite a time in perfection. They are as easy to grow as a camellia, in fact a cool greenhouse just suits them, therefore they are very useful to the florist who has to keep plants in the conservatory attached to the residences of his customers. They can be easily propagated from cuttings placed in

BUNCH OF TWO DOZEN PORTIA CARNATIONS.

ARRANGEMENT OF FLOWERS.

a moderate bottom heat, or from seeds. They can be readily grown into good flowering plants, and do best in a mixture of equal parts of loam and peat with a liberal quantity of sand. In summer they do best plunged to the rim of the pot in ashes in the open air. Some of the species are of a drooping pendulous habit, and are well adapted for training on pillars or back walls of the greenhouse.

Acacia argyrophylla is a handsome dwarf species with silvery green leaves, axillary stalked globular heads of yellow flowers. A. dealbata floribunda is a very free flowering species, producing deep lemon colored flower heads in axillary racemes, and forming panicles at the ends of the branches. A. Drummondi, one of the handsomest of the species, is very dwarf in habit, and flowers very freely, the flowers being pale yellow produced in cylindrical spikes. A. Riceana is a handsome and distinct species, the branches being pendulous, and although it makes a handsome pot plant it is best adapted for a pillar or wall; the flowers are produced in long spikes and are pale yellow in color.

A. pubescens, a fine and showy variety, has small heads of bright yellow flowers in racemes, which are collected into panicles at the ends of the branches. A. grandis, a strong growing species, the flower being large, globular, and very freely produced. A. lineata, an erect shrub, has spikes of yellow flowers produced from the axils of the leaves, and often branched. A. lopantha, a good strong growing variety, has cylindrical spikes of yellow flowers which are produced in pairs from the axils of the leaves. A. albicans is a very good growing variety with white flowers. A. armata, strong growing late flowering species with dark green foliage. The flower heads are solitary in the axils, and are of a rich golden yellow. A. cochlearis, a stiff upright grower, with fragrant yellow flowers which are produced in pairs from the axils of the leaves. A. oxycedrus (syn. taxifolia) is a fine species of very rigid habit with bright green leaves and dense spikes of bright yellow flowers. There are a great many other species, but there is a great deal of sameness amongst them. There were some few nice plants forced for Easter around New York and the florists found them very useful. To the gardeners in the private places these plants are very useful, and should be grown more extensively than they are; they should take the same place here that they do in Europe. They grow freely, take but little heat, and are not very subject to disease.

JAS. S. TAPLIN.

Hackensack, N. J.

New York.

The past week has been one of unexampled dullness. It fairly discounts anything experienced in Lent. There is an abundance of everything in the cut flower line but not a ripple of activity visible anywhere. None of the retailers are doing anything in the way of large jobs, transient trade is at its lowest ebb and it is pronounced by all to be the dullest week of the season.

The situation has been getting worse each succeeding day, for heavy shipments are coming in and as there is no adequate outlet they are piling up in the hands of the wholesalers in a most discouraging fashion. The Greeks are in clover. It is a great time for them and they are having it all to themselves. Roses of fine quality are to be had at $10 to $15 per thousand. Good long stemmed Jacques do not bring over $6 to $8, and more are sold at $2 to $3. American Beauties and other large roses are very plenty; an order for these in quantity at $10 per hundred for best stock would be eagerly gathered in. Brunner is the only large rose that is selling. Harrisii lilies are offered as low as $2 to $4 per hundred. Mignonette, smilax and asparagus continue badly overstocked.

The regular April meeting of the Florists' Club was held in the Elks' Rooms, 19 West 27th Street on Monday evening, 9th inst.

The new quarters proved to be very homelike and comfortable and much satisfaction was expressed when it was announced that the executive committee had secured the rooms for two evenings a month for a year.

The matter of holding a fall exhibition was discussed and finally referred to the executive committee with full power to act.

Messrs. Rath, Burns, Steffins, Storm and Weathered were appointed a committee to make all arrangements for the comfort and transportation of the club on the occasion of the convention at Atlantic City next August.

The question of making the meetings more attractive socially to the members was discussed and an entertainment committee consisting of Messrs. Wells, Weathered and Sheridan was constituted to make suitable provision in this line for the future. It was also announced that a prominent member of the club had expressed a willingness to revive the series of smokers, which were at one time so successful as social adjuncts to the club's more serious work.

Messrs. Weathered, De la Mare and Stewart were appointed a committee to draw up appropriate resolutions on the death of Mr. Thomas L. Russell.

At the monthly meeting of the Farmer's Club of the American Institute on Tuesday, April 3rd, there was an attractive display of decorative foliage and flowering plants. Dr. F. M. Hexamer presided, and Mr. C. L. Allen made interesting remarks upon the selection and cultivation of garden flowers. Mr. Nicholas Hallock spoke in commendation of the remarkable progress which was being made in the development and cultivation of the carnation.

A young man in the employ of Peter Henderson & Co., accidentally fell down an elevator well at the Cortland St. store last Saturday and was so badly injured that his recovery is doubtful.

Boston.

The spurt of activity which followed Easter proved to be short lived and the

week just passed has been generally very dull. One thing, however, has saved it from entire disaster; that is the unusual quantity of funeral work that has been called for, not from one or two establishments but well distributed among the whole number. Designs of all styles have been the rule and it is plain that for funeral purposes at least made up designs still retain their popularity. Prices of all varieties of cut flowers have dropped considerably during the week and there is an abundance of all kinds of seasonable stock in the market, of generally excellent quality. Among the novelties seen are some very fine ranunculuses of which C. Southworth is bringing in a fair quantity, in a variety of bright colors.

At the April meeting of the Massachusetts Horticultural Society notice was given of the presentation to the society by the children of the late E. H. Hitchings, Mr. Hitchings, herbarium of native orchids. The gift was accepted as a fitting memorial of one who had been held in high esteem and a vote providing for its proper preservation was unanimously passed.

On the tables there was a small but interesting exhibition of flowers and plants. That which attracted most attention was a display of a new hybrid primrose raised by T. D. Hatfield. This primrose resembles in foliage, habit, color and fragrance the common English primrose, with the difference that it is of much more robust growth, and the flowers are very much larger measuring on an average full two inches across. The color is lemon with deep orange in the center. It has been named Mrs. E. M. Gill in compliment to a very popular member of the society, and it is whispered that this lady contemplates giving it an appropriate christening at an early date.

Prunus Davidiana, mentioned in previous years as blooming far ahead of all other spring flowering shrubs, is minus flowers this season, the blossom buds having been completely killed in the recent severe freeze.

Chicago.

Last week's business fell short of expectations. Starting in briskly Monday and giving promise of a profitable trade for the week, the demand fell off suddenly towards the middle of the week and was spasmodic to the end.

Stock has been quite plentiful in most lines, roses in particular; these threatened to become a glut, but a steady shipping demand served greatly to avoid a break in prices. Few changes in quotations are noted. Brides dropped from 5 and 6 to 4 and 5. The balance of the rose list remains the same as last week. Beauties are somewhat improving in general quality and the cut is increasing, but good stock is still insufficient for the demand. The same holds as regards hybrids. Of the latter P. Stielow of Niles Centre is bringing in some very fine Baroness Rothschild. Jacques are in supply about equal to demand and are of average good quality; some few lots indeed are extra good. La France is plenty. Most of the stock offered is of medium size, clean and salable blooms and of good color. Here and there a lot of extra size and quality is noted. There is a wide range in prices for this sort, from 3 to 5 for fair stock to 7 to 8 for extra choice.

In carnations there is still a scarcity in white; these command from 25 to 50 cents per 100 more than colored sorts. The latter are plentiful enough. Portia in particular is offered in large quantity, with Tidal Wave a close second. Very few fancy sorts are offered. Daybreak is about the only variety in this class that is sent in in any quantity. Of these some choice blooms are noted which find a brisk demand at $2.

Very little bulbous stock is seen on the market. Many growers report being cut out entirely; still prices have not advanced any. Valley is in good demand; the supply offered is limited and sold out clean every day.

Violets are very scarce, the supply being far short of the demand and quality very inferior.

C. A. Samuelson opened up his new store in the Lexington Hotel, 2129 Michigan avenue, on Monday last. Mr. S. intends to pay more attention to the plant trade in the future, and as his new quarters are roomy and well lighted they are well fitted for the purpose.

Klunder has moved a few doors south and is now located at 2124 Michigan avenue.

Further changes around 22nd street and Michigan avenue will be made by May 1, which will concentrate the business of this locality practically in one block.

Blaumeiser Bros. of Niles Centre are opening a retail establishment at 745 Wells street, with an entrance also at 8 Lincoln avenue.

A meeting of the directors of the Chicago Cut Flower Exchange was held Monday, April 9. The meeting opened with President Rudd in the chair, 8 members being present. The question of ways and means to carry on the Exchange, involving the future prospects and success of the enterprise was thoroughly discussed, but it was soon discovered that the directory was hopelessly divided on some of the vital points. The majority of the members were in favor of continuing business, but the modus operandi proved the rock which foundered an enterprise springing into existence a year and a half ago with every promise of a profitable and successful future.

The first vote was taken on a motion to run a commission establishment by the management in conjunction with the exchange. The motion was lost, 3 members voting for and 5 against the proposition. The next vote taken was on a motion to continue business, excluding the commission feature, which also was lost by a vote of 2 for and 6 against, thus sounding the death knell of the association.

A meeting of stockholders is called for 10 a. m. Friday, April 13, for the purpose of winding up the affairs of the corporation. It is hoped that every member who is unable to attend in person will send his proxy, as it takes a two-thirds vote to accomplish the purpose. There is still a possibility of the stockholders rescinding the action of the directory, but such a step seems hardly probable, since many of the growers for whose benefit more than any other interests the exchange was started have been rather lukewarm in their support from the very beginning.

Mr. P. Vos, of P. Vos & Co., Sassenheim, Holland, is in town.

Henry Hammes and wife have gone to California on a pleasure trip.

DO YOU WANT a complete alphabetical list of roses in commerce in America up to date, with class, name of introducer, date of introduction, and brief, accurate description of each? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

Philadelphia.

The new city council convened on Monday, April 2, and this occasion was made memorable by a great display of flowers. Every member's desk was graced with at least one basket or bouquet, while some new members and others who had only barely succeeded in being re-elected after a hard battle were the recipients of numerous and in some cases immense pieces of most wonderful construction. The most popular form was the horseshoe, and one member who could not occupy his seat on account of the floral pieces piled on it stood in the aisle under a horseshoe seven feet in height. It is to be hoped the refining influence of this wealth of flowers may make itself felt in the legislation of the coming session.

The plans looking to the rebuilding of Horticultural Hall are now getting into shape. A proposition, which has the indorsement of quite a number of the wealthy members of the society, in so much that they have agreed to raise $150,000, calls for the business interests to provide $50,000, and this amount it is expected will be sufficient to erect something magnificent. Whether these large sums of money will be raised is hard to say, but it does seem as if something beneficial to the society will be the result if earnest efforts are made to secure the necessary capital.

Some of the fakirs are not satisfied with getting their stock cheap and at times for almost nothing. They want to be like the fellow that could sell his brooms cheaper than his competitor who stole the material and made them, because he stole them ready made. So a select few have been making visits to nurseries in the suburbs in the shades of evening when their chocolate colored skin (they were all colored) was not so noticeable. Messrs. Chas. Menke, Dennison Bros., J. G. Eisele, Hugh Graham and S. S. Pennock have each in turn suffered by these midnight visitors, who do more damage by reason of the stock destroyed than that carried away. They have been captured, however, and one of them (there were three in all) making a confession which implicated the others, they are likely soon to be placed where they will not bother the growers for some time.

Business has been moving lively the past week, although it is evident that flowers are more plentiful and there is not that eager rush for stock that was such a joyful sight to the growers a week ago. Prices for roses are about the same as last week, but with a falling tendency, as a special offer on a job lot is eagerly entertained by the grower. The quality keeps up very well, although the Brunners are beginning to have an off-crop appearance. Mr. Lonsdale has had some moss clusters which were very pretty, but says they do not bring enough to make them a profitable crop.

Carnation stocks seem to be growing, as orders were more easily filled the past week, but $2 is still low for anything salable, while $2.50 to $3 is asked for selected flowers. Sweet peas are becoming more abundant and better, but $2 is still asked for common and $3 for choice stock. There are still a great many lilies about and almost any price is asked for them, no reasonable offer being refused.

The last meeting of the Florists' Club, April 3, was very well attended. The paper on "Advantages of hot water under pressure over steam," to be read by Mr. Eisele, was not forthcoming, as that gentleman in a letter to the secretary said that the pressure of spring business was

BUNCH OF MIXED FLOWERS FOR A VASE.

ARRANGEMENT OF FLOWERS.

so much greater than the pressure of hot water that he was compelled to postpone the subject for a later meeting. Mr. J. Westcott is to prepare a paper for the next meeting on how best to entertain the delegates to the convention in August. This is Mr. Westcott's particular line and no doubt he will map out a program that will give all the members a part to their liking in helping to make everybody feel at home during their stay.

Mr. J. L. Dillon of Bloomsburg had a vase of fine carnations on exhibition, seedlings and sports; a large full flower with good stems and fine dark crimson color, a sport from Unique, looked well, as did several pink varieties, all having good solid flowers and long, stout stems.

George Anderson is in luck again. It is a girl; this makes nine. Nine fine healthy girls! Of course this means nine sons-in-law. George will be quite a father some of these days. K.

Buffalo.

The weather since Easter has been more wintry than the greater part of March, which has somewhat hurt the sale of plants, but several weddings and social events have kept all hands moderately busy. There is not any surplus of flowers noticeable. Roses of all kinds when good are readily sold. Carnations are getting the most plentiful. Tulips and daffs are very fine just now and if they don't bring midwinter prices there is a good demand for them.

The most important floral event since Easter was the marriage of one of that numerous family of Smiths. The decorations, both at the church and at the house, were very beautiful and were well taken care of by Messrs. Adams & Nolan, "the hustlers."

This is a pretty good city for summer plants used in many ways and now that the Easter stock is gone the chief plant men, Christenson, Milley, Scott, Rebstock, Belsey and others, are in a terrible haste. If you are lucky enough to get a view of them outside their houses, they are rushing along as if pursued by a swarm of hornets and if prevailed upon to stop an instant and drown a few of the imaginary beasts have little time for any superfluous chat.

Professor Cowell finished a course of botanical lectures last week which he has given before the Woman Teachers' Association. His "talks" have been most comprehensive, including many branches of this fascinating study. The lectures have been widely appreciated by hundreds other than those for whom they were especially intended. It is not every city that can lay claim to such a thorough botanist as "our professor."

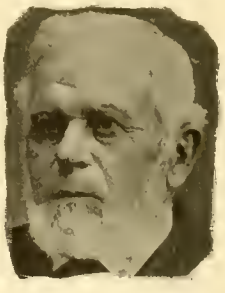
We had a very pleasant surprise last Friday in the visit of Peter Crowe, of Utica, who came to Buffalo to meet Mr. Charles Erhardt of Erie St., Cleveland. They looked over the stores and then in company with three or four of our veterans took in the silver dollar bowling alley and several other innocent amusements which generally come to the front wherever two or three discreet florists are congregated together. Mr. Erhardt expressed himself as having had the finest evening of his life and was surprised at the fraternal feeling shown among the florists here. He said it was entirely different in his town. Perhaps he is mistaken about it. We hope so. He is certainly a lively young man and timothy won't attain a great height where he is holding forth. W. S.

OBITUARY.

A. LAUER.

Mr. A. Lauer, the well known florist of Louisville, Ky., died last week. Mr. Lauer was born in Germany. He came to America 32 years ago. He originally studied for the ministry but finally became engaged in floriculture. He was an active business man in Louisville and was quite successful. His establishment was opposite Cave Hill Cemetery, where he did an extensive business, especially cemetery work. Mr. Lauer was well liked by all in the trade and was always foremost in any project looking to the advancement of the profession. He was conscientious and painstaking and was considered one of our most successful florists. For the past six months he has been confined to his home as the result of injuries received in a street car accident, and these injuries probably hastened his death.

His remains were laid away in Cave Hill Cemetery, the funeral being attended by the florists of Louisville in a body, who thus paid their last respects to one who will be greatly missed in the profession.



Mr. Lauer leaves a widow and an invalid son to mourn the loss of a good husband and father.

It is not likely that his family will continue the business as his widow has no knowledge of the business, and her time is fully taken up in attendance at the bedside of her invalid son. N. & N.

PAUL BUTZ.

Paul Butz, senior member of the firm of Paul Butz & Son, New Castle, Pa., died April 5, aged nearly 73 years. He had been ill for some time and the end was not unlooked for.

Paul Butz was born April 30th, 1821, in the city of Basle, Switzerland. The

THE LATE PAUL BUTZ.

greater part of his youth was spent in traveling in Italy, Germany and France. While in Paris he learned the florist's art to which he devoted all his subsequent life. In 1851 he came to America, and after remaining for a year in Pittsburg, removed to New Castle, purchased several acres of land and laid the foundation of the business which has since grown to

such an extent. In 1852 he was united in marriage to Miss Margaret Wiegand, who survives him. Twelve children, all of whom are now living, blessed their union. The sons are Wm. T., a member of the firm of Paul Butz & Son, florists; John M., who is in the employ of the Pennsylvania Company; Frank P., with the Western Electric Works, of Chicago; George C., professor of horticulture and botany at the Pennsylvania State College; Albert E., a student at Curry Institute; Harry A. a student at the New Castle High School. The daughters are the Misses Maggie, Effie R., Rose S., Emma C., Mary A., and Carrie. The deceased had a number of relatives residing in various parts of the United States, four of whom, three nephews and a niece reside in Pittsburg.

Mr. Butz was a member of the first city council of New Castle, remaining in office for four years. For a quarter of century he has been a Mason.

He was a man upright in all his business relations, and enjoyed the confidence and respect of all who knew him. His business ability, as attested by his chosen line, was excellent. He was a loving husband and the best of fathers.

News Notes.

ROCKLAND, MASS.—Mr. E. P. Fullerton of Whitman has opened a florist store in this town.

MISSOULA, MONT.—E. C. Eyl has sold his florist business to Mrs. Wm. Neill and has left this place.

DAYTON, OHIO.—Dayton florists are well pleased over their Easter trade, cut flowers and pot plants selling equally well.

SAN FRANCISCO.—Easter trade varied but little from that of last year. The only noticeable change was an increased call for Bermudas and orchids.

FT. SCOTT, KANS.—The 9 year old son of W. P. and Alma S. Patterson, the florist, accidentally shot and killed himself April 3. Mr. and Mrs. Patterson have the sympathy of their friends in the trade in their affliction.

LEXINGTON, KY.—W. S. Ball has just finished a very fine house 23x120. Jno. A. Keller has added another new house to his range, 21½x103. Mrs. D. Honaker has just completed two new houses, 30x150 and 20x90 respectively.

SPRINGFIELD, O.—Charles A. Reeser, president of the City Council and leading florist, assigned to Albert H. Kunkle, city solicitor, for benefit of creditors. His liabilities are estimated at $23,000; assets, $15,000. The assignment is due to the hard times.

WEST GARDNER, MASS.—Easter trade was considerably larger than last year. Harrisii lilies in pots sold well, also cut spikes of Harrisii and candidum. Roses, carnations, pansies, and mignonette were all in good demand but the supply was sufficient for all.

SARATOGA SPRINGS, N. Y.—A good increase. Larger demand for carnations and lilies. The calls for azaleas and hyacinths were also large. John Ralph's display was described at length in the *Daily Saratogian* and mention was also made of that by T. J. Totten.

OTTAWA, CANADA.—Easter trade was about 20% larger than last year, but prices were lower. Supply not quite equal to demand. Quality superior. Home production much larger, hence bought less. Not half enough violets. Increase in plant trade. Not enough Harrisii.

LOUISVILLE, KY.—Mr. Jacob Schulz is just putting the finishing touch on three magnificent new houses, all built after the new plan, short span to the south, using best cedar and cypress for material and 16x24 glass. The houses are 18x140. Mr. Geo. Schulz has also been building, putting in two new houses 11x104. J. N. Struck and Bro. are the builders.

OAKLAND, CAL.—Easter trade was about 60% larger than last year. Prices about the same. Supply short. Quality good. Bought more and sold at a profit. Increased call for Bermudas and callas. In view of the general depression in other lines of business we think the demand was remarkable. The supply of most flowers was about the same as last year. Lilies were more forward and consequently more plentiful, yet there were not enough to meet the demand.

GRAND RAPIDS, MICH.—A slight decrease with individual florists, owing probably to the increased number of those in the business. Prices ruled about 30% lower than last year. Supply was fully equal to demand, of many things there was a surplus. Quality superior. Increased call for carnations on account of their being of extra quality and cheap in price. Spiræa could not be sold and azaleas were a drug even at wholesale prices. Callas would not sell at all. There was plenty of nearly everything.

MANCHESTER, N. H.—With an experience of ten years in this city the writer has never seen such a demand for flowers as was experienced during Easter week. The biggest sale was for lilies, longflorum being the favorite and Harrisi coming next. Candidums were in poor demand and are plainly a thing of the past. A large proportion of the lilies sold were in pots. The rush for white carnations on Friday and Saturday was unprecedented and on Saturday afternoon it was impossible to supply the demand from any source. Prices are as follows: Longiflorums 25c., Harrisii 20c., candidums 10c., carnations $5 per hundred, roses from $15 to $40 per hundred.

—THE ORIGINAL STO[CK]

H. HUEBNER, Grotor

St. Louis.

Trade for the past week has been fair. The supply has developed a tendency to break the market, but as yet no demoralization in prices has occurred. Home plant trade still continues poor, while the shipping has also fallen off considerably as a result of the recent cold wave. W. Ellison has been receiving lately some very fine Hinze's and Portia carnations from Swan Peterson, the stems are remarkably long and stiff; the peculiarity about this stock is that when received it appears never to have been placed in water, although not at all wilted; the flowers are about half blown and not very large, but upon being placed in water for twelve hours or so they open up remarkably and rank way up ahead. Some fine Buttercup and Chester Pride, have also been coming in from J. F. Amman; the Buttercup are exceptionally fine and come a bright clear yellow. For the first time this season the fakir has made his appearance upon the streets. R. F. T.

Counting Lily Blooms on the Plant.

There seems to have been considerable misunderstanding and more or less complaint this season from various sources regarding the methods adopted by many lily growers at Easter in counting lily blooms. Whether all the buds on a stalk, regardless of their stage of development, should be reckoned the same as opened flowers or whether all those buds which are ready to burst should be so counted, the small green ones being reckoned at a lower price or left out of consideration altogether, is a question upon which it would seem desirable to have a general agreement, so that growers may have a uniform method, and buyers know just what they have a right to expect. We should be glad to have an expression of opinion from those interested in the matter and our columns are open to any who desire to participate in the discussion.

Please mention the AMERICAN FLORIST very time you write to an advertiser.

SOMETHING NEW.

Clematis Gen. Grant, or Crimson Jackmanii.

STRICTLY AN AMERICAN SEEDLING, and possessed of qualities not common to foreign grown sorts, namely extreme hardiness and vigor, flowers in racemes of great size, substance, and depth of color; color a maroon crimson changing to a deep purple in the old flowers, and lasting a long time, in several cases over a week in good condition after being cut. This variety will be highly prized when known, on account of its peculiar lasting qualities, and being so well adapted to our hot suns and dry atmosphere—practical florists will understand this.

Price, good plants, $1.00 Each; $9.00 per Dozen. Very strong plants, home-grown, $1.50 Each; $15.00 per Dozen.

P. S —Plants can be had of the undersigned, or of J. C. Vaughan, Chicago; or Phœnix Nursery Co., Bloomington, Ill.

CLEMATIS.

12 Choice leading kinds. Large flowering
Two years . . $3 per doz.; $22.50 per 100
Three years . . $4 " $30.00 "
DAISIES. —Snowflake and Snowcrest, distinct kinds, indispensable for spring sales, $2 per 100.

SMILAX SEEDLINGS,
from fall, 75 cents per 100; $6.00 per 1000.

Catalogues Received.

H. H. Berger & Co., San Francisco, trade list bulbs and plants; J. W. Manning, Reading, Mass., hardy plants; L. Van Waveren & Co., Hillegom, Holland, bulbs; Knepper & Van't Hof, Boskoop, Holland, plants, trees and shrubs; Sam'l C. Moon, Morrisville, Pa., nursery stock; C. W. Talbot, Nevada, Mo., plants; R. Douglas & Son, Waukegan, Ill., hardy ornamental evergreens; E. H. Hunt, Chicago, trade list seeds, bulbs and florists' supplies.

WE HAVE RECEIVED from Mr. F. J. Ulbricht, Anniston, Ala., blooms of the so-called bridal rose, evidently a double flowered rubus or bramble. The flowers are snowy white, very double, and the size of Clotbilde Soupert rose; a very pretty thing. Our correspondent writes that it produces an enormous crop of flowers, and is very useful in design work. If kept in shape plants of this should force very nicely for Easter.

DO YOU WANT a list of trade organizations, both national and local, with names and addresses of principal officers, time and place of meetings and other information? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

DO YOU WANT a complete alphabetical list of carnations in commerce in America, with name of introducer, date of introduction and brief, accurate description of each? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer, 114 Chambers street, New York. Next annual meeting second Tuesday in June, at Toronto, Ont.

CHAS. A. REESER, seedsman and florist, Springfield, Ohio, is reported to have assigned.

PEAS AND BEANS are very short; onion seed continues to move fairly at the low prices.

TWENTY-TWO Dutch travelers in the bulb trade are said to be in America at this time.

THE Middletown, Conn., *Tribune* of March 13 prints an engraving of the seed store of Fred. P. Burr & Co. with a descriptive article noting the large increase in their business since they started 16 years ago.

THE catalogue mail trade has suffered greatly from the cold, damp and unseasonable weather of the past 15 days, the receipts falling off from 35 to 50 per cent. Grave doubts exist whether the trade will come on again as actively as in March. The total trade for the season is now certain to fall behind last year considerably.

DO YOU WANT a list of firms in the trade that issue catalogues, with key showing proportion of space given each branch of the trade in same? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

·D·I·R·E·C·T·O·R·Y·

— OF —

FLORISTS, NURSERYMEN AND SEEDSMEN

— OF THE —

UNITED STATES AND CANADA,

— AND —

REFERENCE BOOK,

FOR 1894,

IS NOW READY....

CONTENTS.

The names and addresses of all the Florists, Nurserymen and Seedsmen in the United States and Canada, arranged alphabetically in States and Provinces, the exact branch of the business each is engaged in being indicated by the following

····KEY····

F Florists who do a general local trade, having greenhouses and retailing the product of same.
G Florists who grow cut flowers or plants for the wholesale market and who do not sell at retail. Almost always within a short distance of a large city.
R Retail store florists who have no glass of their own. Nearly always in the large cities.
D Wholesale commission dealers in cut flowers.
N Nurserymen.
X Those who are both Nurserymen and Florists.
S Seedsmen.
Z Those who are both Seedsmen and Florists.
A Those who combine all the branches, viz.: Florists, Nurserymen and Seedsmen.

····ALSO····

A list of Trade Organizations, both National and Local, with names and addresses of principal officers, time and place of meetings and date of organization.
Statistics regarding Floriculture, the Nursery Industry and Seed Growing from the last U. S. Census report.
A list of firms in the trade that issue catalogues, with a key indicating the prominence of each branch of the trade in same.
A list of leading Cemeteries in which attention is paid to Ornamental Horticulture.
A list of leading Park Superintendents and of the Botanical Gardens of the United States.
Seasonable Hints for the year about the practical work of the Florist, written by Wm. Scott, giving instruction not only when to do certain work, but how to do it most effectively and economically.
A complete alphabetical list of Roses in commerce in America, brought up to date and of incalculable value for reference.
Similar lists of Chrysanthemums and Carnations.
Historical sketches to date of the Society of American Florists, American Carnation Society, National Chrysanthemum Society of America, Florists' Hail Association, American Seed Trade Association and American Association of Nurserymen.
A list of Leading Horticultural Societies.
Full and accurate information about Express and Postage rates.

Toronto.

March just past was 7° higher than the average of 53 years, the mean temperature being 35° and a decimal. The weather since Easter has been cold but outdoor gardening operations are now beginning, which at least looks as if spring was here. The poets have however scarcely been able to get up enough enthusiasm to break out into verse yet.

I omitted to mention in my last notes that many more of the churches in this city than in former years decorated with plants and flowers for Easter day. Public opinion has changed a great deal in this respect during the last few years. Formerly some of the denominations who now decorate extensively, held that to adorn a church with flowers was not to be thought of.

Trade lately has been gradually tapering off to a pretty fine point and prices have likewise been undergoing the same process. Now that business has settled into the ordinary work-a-day rut again and florists can take a calm retrospect of the Easter trade, most of them seem to be fairly well satisfied and to consider that things have not gone back at all in spite of the universal hard times. E.

Bethlehem, Pa.

It is with feelings of pleasure I write you that we have had a mild March which brought all stock forward finely. From Monday until Wednesday Easter week the weather was fine, Thursday and part of Friday we had rain which dampened our spirits and sales to a considerable extent, Friday noon it cleared and our spiritual thermometer went to the 90° mark, and by Saturday night all florists were cleaned out of everything that had a flower on it. Sales were one-fifth larger than last year. Azaleas, hydrangeas, genistas, astilbe, Harrisii lilies, hyacinths and tulips sold best. In cut flowers the demand run to bunches of loose, or boxed for mailing, roses and carnations being preferred. Designs went slow. Our sales are mostly for cemetery decoration, which is an extensive custom here. JACOB A. FRIES.

To the Florists.

I am ready now to give a test without cost for keeping cut flowers or plants in blossom perfectly fresh and full of vitality for at least ten days. Anyone desiring to have such a test can send me specimens of what they may desire to test, marked and sealed, at No. 68 South Water Street, and I will return them to the sender in 8 or 10 days for their inspection.

As I have decided to build preservers for Florists, etc., and as I don't desire anyone to spend any money before they know what they get, I make the above proposition to give a test to anybody who desires one.

Address The Allegretti Refrigerator Co.,

No 68 South Water St. *CHICAGO*

Tuberous Begonias.

GRIFFIN'S STRAIN.

Medal Awarded at World's Fair.

We are headquarters for the above, the finest strain in the world. Send for illustrated descriptive catalogue with copyright engravings. It tells you all about them.

OASIS NURSERY CO.,

For 1894

IS NOW READY.

Price $2.00.

AMERICAN FLORIST CO.

New Orleans Horticultural Society.

The seventh annual exhibition of this society was held at the Washington Artillery Hall March 29 to April 1 inclusive. Taking all things into consideration, this was the largest and finest exhibition ever held in the city, though some things were not up to the standard owing to the unusually cold weather preceding the show, which made flowers scarce.

In cut flowers, designs and decorations there was some fine work from C. W. Eichling, C. Eble and U. J. Virgin, C. Eble being first for mantel and C. W. Eichling first for table decoration, both using very fine flowers. M. Cook and J. H. Menard made a fine display, also R. E. Simons, not for competition. The large groups of palms made a great feature of the show. In the classes for private gardeners H. Papworth and John St. Maud ran very close in the collection of foliage plants, the prize (a sewing machine) going to Mr. Papworth. In Mr. St. Maud's group was the finest Adiantum Farleyense ever seen here. H. Papworth also took two prizes for orchids. In the florists' classes M. Cook and C. Eble took several plant prizes; J. H. Menard and E. Valdejo were also successful exhibitors. Several of the local seedsmen also made a nice display.

The society was greatly aided by prominent people of the city, who showed their interest by several special prizes. E. G. Hill of Richmond, Ind., gave a special prize for geraniums, J. C. Vaughan of Chicago, special for World's Fair cannas, and Jas. R. Pitcher of Short Hills, N. J., special silver medal for collection of flowering and foliage anthuriums. H. P.

Greenfly.

ED. AM. FLORIST: In the November, 1893, number of *Insect Life*, issued by the U. S. Dept. of Agriculture, on page 15, remedies for aphis are given. The one most favored is a resinous solution made by dissolving the resin with caustic soda or carbonate of soda. The effect upon greenfly is immediate. If any of your subscribers have tried it, it would be very interesting to have them note the results in the FLORIST. F. C. CURTIS.

WOOD BROTHERS, Fishkill, N. Y.

St Paul, Minn.

Trade continues fairly good, with no particular change. Retail prices of cut flowers remain firm and the demand is equal to the supply. Beauties are more abundant and of better quality. Bulbous stock is about all gone and none of the florists regret it. The opinion prevails that while valley and Romans are invaluable, and daffodils, tulips and Dutch hyacinths are in demand at Easter the growing of many Dutch bulbs is unprofitable and the results too uncertain to warrant their extensive use in future. The profits on bulbous stock, as is well known, are not large, and while the labor, time and space in bringing them into bloom is not great, the uncertainty of sales and the growing popularity of roses, carnations and cheap potted plants will make our florists more cautious than ever in buying bulbs. For bargain sales in department stores they may be attractive, but for certain profits in commercial establishments they are not.

Favorable weather the past week gave promise of an early spring and consequent early demand for bedding plants. Now that Easter flowers are out of the way bedding plants have more space and more attention and should be in prime condition when wanted for planting out. Our summers are short at the best and people want large plants for immediate effect when planting time arrives.

Society has hardly recovered from the Lenten lethargy. Several events, however, are booked for the near future and with several weeks of gaiety before the outing season arrives our florist friends should feel much encouraged.

"Glass Block" Donaldson, of our sister city, is again selling cheap flowers. We presume he buys them at home, as we have not learned of any being sold him in St. Paul. Department stores here have also offered "cheap flowers"; whether they really were cheap or not the writer cannot say.

John May, the genial manager of L. L. May's city store, has been passing the cigars around. It's a boy and looks like his daddy. FELIX.

DURING a recent visit to the Quaker City Machine Works, Richmond, Ind., we were much interested in the special machinery used in the manufacture of their Challenge Ventilating apparatus. Mr. Evans is quite a genius in devising labor saving machinery and is continually studying out improvements for his Challenge apparatus. The firm build engines and do a general machine shop business but the ventilating apparatus department has come to be one of the most important.

DO YOU WANT a list of the cemeteries of the country that use trees, shrubs and plants largely in the ornamentation of their grounds and that are apt to be large buyers of these and other horticultural supplies? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

Please mention the AMERICAN FLORIST every time you write to an advertiser.

BAY STATE HARDWARE CO.,
244 Freeport Street, BOSTON, MASS.

Directions for Using Fenster Pappe.

A SUBSTITUTE FOR GLASS.

Stretch **Fenster Pappe** taut and use batten in nailing on to sash. Then paint the rough surface thoroughly with boiled linseed oil until it shows a gloss. Let it become THOROUGHLY DRY before using, when it is claimed to do service for years. The application of the oil makes FENSTER PAPPE sufficiently translucent for plant life.

IT IS USED as a covering for cold pit sash; excellent for use in palm or fern houses; to grow strawberry plants, early vegetables, tobacco, etc.. under. A most handy article as a protection against the direct rays of the sun.

TRY a roll of eight yards as a sample, which will cover about four sash, for $1.00. Original rolls, 36 inches wide, 110 yards long, for $9.00.

For further particulars address

BLOOMFIELD, N. J.—Phineas J. Ward, for many years a wellknown and prosperous florist of this town, died on April 3, aged 75 years.

CAMDEN, N. J.—M. P. McCaffrey, owner of the West Moorestown greenhouses, was arrested on March 29th on a charge of forgery preferred by John Leworthy, a Moorestown business man.

PORTSMOUTH, N. H.—Easter trade in Portsmouth was decidedly the best we ever had, the whole amount of trade done being from 25 to 35 per cent larger than that of last year. The increase was principally in plant sales. There was an almost entire absence of any demand for designs, loose flowers being in nearly all cases ordered. Harrisii lilies were in greater demand than ever and the stock in this market was first-class.

LOUISVILLE, KY,—A daily paper reports that "George and Frank Morat have sworn out a distress warrant in Magistrate McCann's court against F. L. Morat. All of the parties are interested in the large Morat nursery near the racecourse and the plaintiffs claim that the rent on the place has not been paid. The amount claimed as due them is $1,000, and an order of sale has been issued, and unless the claim is paid, the property will be sold on April 16."

NEVADA, MO.—Arrangements have been made for a chrysanthemum show here next November to be given under the auspices of the Epworth League. The League has made arrangements with florist C. W. Talbot to supply one chrysanthemum plant now to one child in every family in this section, with instructions about growing the same to be entered for prizes at the exhibition. It is expected that about 1500 plants will be grown in this way. In addition Mr. Talbot will make a display of about 800 plants of his own growing. The local press has given the project quite a send-off.

GREENHOUSE HEATING AND VENTILATING

Horticultural Architecture and Building.

HITCHINGS & CO.

Established 1844.

233 Mercer St., NEW YORK.

FIVE PATTERNS OF BOILERS.

NINETEEN SIZES.

Perfect Sash Raising Apparatus.

Rosehouses, Greenhouses, Etc., of Iron Frame Construction, Erected complete, or the Structural Iron Work shipped ready for erection.

Iron Frame Benches with the "Perfect Drainage Bench Tile" or Slate Top.

SEND 4 CENTS POSTAGE FOR ILLUSTRATED CATALOGUE.

"ADVANCE" (Trade Mark.) For Hot Water.

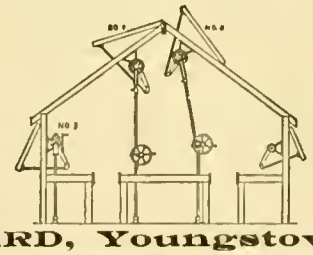
ARE YOU interested in the best modern system of heating your Greenhouse. If so write to us for Catalogues. We make a specialty of greenhouse heating.

18 TYPES. 174 SIZES.

FOR STEAM AND HOT WATER.

ADAPTED TO ALL KINDS OF FUEL.

American Boiler Company



BOSTON: 195 Ft. Hill Sqr. NEW YORK: 94 Centre St. CHICAGO: 84 Lake St. PORTLAND, ORE.: 127 Sixth St.

VICTORY! VICTORY! VICTORY!

The only Certificate of Merit awarded for ventilating apparatus at the St. Louis Convention was to the

POPULAR STANDARD VENTILATING MACHINE

The florist's friend in working and prices.

No repairs for 5 years. no chains to break as is the result with others.

Opens Sash uniform on 100 foot houses. A new device.

MEADVILLE, PA.—Easter trade was very good, far better than we thought it would be. Prices about the same as last year.

PORTLAND, OREGON.—Easter trade was 20% larger than last year. Retail prices about as usual at the season. Supply was equal to demand. Quality superior. Increased call for violets, roses and carnations.

CINCINNATI.—Easter trade was 25% better than last year. Prices not so high. Supply was not equal to demand, especially roses and carnations. Quality was superior. Marked increase in the call for roses and carnations.

COLUMBUS, O.—Easter trade was somewhat of a decrease from last year. Prices lower, especially on bulbous flowers. Could have sold more roses, carnations and violets. Roses were not as good as last year in quality, other stuff better. Increased demand for roses and violets. More call for blooming plants than ever before.

Books on Gardening.

[A paper read before the Gardeners' and Florists' Club of Boston, by B. M. Watson, Jr. of the Bussey Institution. With a list for American readers, proposed for emendation and correction.]

Plant growing is an art; it is not a science, nor is it likely that within any reasonable time garden craft will take such rank. It is however, quite proper to speak of scientific gardening, meaning by this that it is practiced with an appreciation of all sources of information which the art in its present stage can furnish. The knowledge which the present generation of gardeners possess has been attained from the experience of past generations of gardeners, sometimes handed down by word of mouth; sometimes recorded in print. It is quite possible for a man to have a good knowledge of plant growing without ever having read a book; in my opinion it is not equally possible to obtain such a knowledge from books alone. Therefore, to avail ourselves properly of all our resources in this art, one must have first acquired fr m some competent person a certain amount of practical instruction, after which, if of average ability, he is quite able to increase his knowledge, and extend it in directions different from those taken at first; that is, one who knows how to grow vegetables can easily learn how to grow flowers; it is not difficult, after the first lessons have been learned, to branch out in many directions.

It is for men who can grow plants that books on gardening are written; there is no horticultural primer; the A B C must be learned orally, and sometimes these words are hard, from one who has attained his knowledge in the same way, and who may or may not have increased his original information by his own faculty of observation, and his power to reason from cause to effect. For a man who has had practical experience in plant growing books are invaluable; a few sentences here, a chapter there, may save weeks of labor; one can thus profit at minimum cost with maximum result from the experience of other men.

As the question: What are good books on gardening in its widest signification for men who wish to become gardeners, or who wish to increase their information? is frequently asked me, I take this opportunity to answer somewhat at length.

I would divide these books into four different classes. First, there are general works which cover the whole ground, such as Lindley's Theory and Practice of Horticulture; Loudon's Encyclopædia of Gardening; Decaisne and Naudin's Manuel de l'Amateur des Jardins; Thompson's Gardener's Assistant. These are books which should belong to everyone who has to do with growing plants; the first should be carefully read, but the last three are rather books of reference to be read topically as occasion demands.

Secondly, there are special works on particular subjects: the first of these is soil; Johnson's How Crops Feed and How Crops Grow; Storer's Agriculture; Harris' Talks on Manures; Waring's Drainage for Profit and Health; Stewart's Irrigation for the Farm, Garden and Orchard, are all alike practical books which cannot fail to help one in either gardening or farming. They assist us to understand the important relation of plants to soil, and to provide means for improving the condition of the crop under unfavorable circumstances. By such aid many common operations of gardening are explained, and it is by the writings of men like Johnson and Storer that we may hope so to increase our knowledge of plant growing that larger profits will follow smaller investments. Gray's Structural and Systematic Botany, Goodale's Physiological Botany, Sach's Textbook of Botany, tell us how plants perform their various functions, and of what they are composed; they should be studied and read in connection with Johnson and Storer. The student of horticulture, however, should always bear in mind that it is the gardener's art to make a profitable cultivation; it is necessary not only to make a plant live, but in most cases, it is required that there shall be a return; it is not sufficient for the gardener, as it is for the agricultural chemist, that the soil is rich enough to produce fruit; he must get fruits; he must get enough to pay the cost of tillage and a little more. There is no need to reduce this to dollars and cents; if the planting is for ornament, if the cultivation is to increase our enjoyment of life, we strive to obtain a healthy plant and maintain it in good condition from first to last, not only to have a given tree or shrub, but to have such a one as will show its individuality best.

In this second class belong also books on propagation. Bailey's Nursery Book; Jenkins' Art of Propagation; Fuller's Propagation of Plants; Burbidge's Propagation and Improvement of Cultivated Plants, this last particularly helpful to those interested in hybridization; Baltet's Grafting and Budding, of which there is an English translation, in addition to what may be found on this subject in the general works on horticulture at the head of this list, will give the beginner most useful information, and may help the old practitioner by showing shorter cuts, even through familiar grounds. A little later I shall refer to books which treat of a single class of plants; it is almost unnecessary to say that in each there is always a chapter on propagation; if some of the English growers would read Lamborn's Carnation Culture and believe it, we should hear less in the English journals of layering this, now, thoroughly Americanized plant.

Plant growing naturally divides itself into cultivation under glass, and cultivation in the open air; following this indication in our list of books we find a somewhat meager choice offered in those which relate to building plant houses; indeed, if it were not for two books, one recently published, there would be little to recommend, but Prof. Taft's Greenhouse Construction is admirable, and a welcome addition to a shelf well nigh bare. Horticultural Building, by F. A. Fawkes, an Englishman, is also of assistance, if due allowance is made for difference of climate. In Hunt's How to Grow Cut Flowers, and Peter Henderson's Practical Floriculture, there are excellent chapters on this subject; Woodard's Graperies and Horticultural Buildings might also be added. In regard to methods of heating there is nothing except what is contained in the above named books and a few pamphlets; good information may be obtained, however, from the dealers, notably Hitchings of New York and Lord & Burnham of Irvington, N. Y., who publish an attractive catalogue of their boilers, with an instructive account of heating by hot water.

For books on growing plants under glass there are the two named above by Peter Henderson and Hunt; Williams' Choice Stove and Greenhouse Plants and his Orchid Growers Manual; Burbidge's Cool Orchids, also many which consider a single species only, as Burbidge or Morton on the chrysanthemum; Lamborn or Dodwell on the carnation. For growing fruit under glass there is the Orchard House, by Thos. Rivers; and for mushrooms, Falconer's Mushrooms, and How to Grow them.

Growing plants in the open air naturally presents many different phases. An excellent list of books pertaining to laying out and design; i. e. landscape gardening, was made by the late Mr. Henry S. Codman, and published first in the *American Architect*, afterwards in *Garden and Forest*, Vol. III, page 131. Of this list I will name one only here, and that is L 'Art des Jardins, by Edouard Andre. It is unfortunate that there is no English translation of this remarkably complete work, wherein is set forth, in most complete detail, the various operations required in planning and establishing the modern park or country place. I know of no good book on trees and shrubs in English for ornamental planting; Du Breuil's Culture des Arbres et Arbrisseaux is good, but written for a milder climate, nor does it include many plants of recent introduction, and many neglected American plants which are likely to be of great importance in the near future in this country. The four German books given in the list below are highly recommended. There are plenty of books on roses; read Ellwanger and Reynolds Hole; Rand on Rhododendrons might be added. In forestry there is Hough and Jarchow, which are new, and Fuller of recent date. Forestry in this country is too young to enable one to give much definite information as to the management of existing woodlands, and the best trees to plant for timber. Its importance cannot be overestimated and all literature on the subject should be considered.

For the flower garden there are plenty of books; for growing herbaceous plants get Robinson's English Flower Garden, Wild Garden, and Alpine Flowers; Allen's Bulbs and Tuberous rooted Plants; for bedding out, use Peter Henderson's Gardening for Pleasure; Robinson's Subtropical Garden and Gleanings from French Gardens; Mrs. Loudon's Ladies' Flower Garden for Annuals, and John Robinson's Ferns in their Homes and Ours. Avoid books with highly colored lithographs showing how coleus, alternanthera and echeveria can be planted in countless numbers in intricate designs.

For growing fruits Downing's Fruits and Fruit Trees of America; Barry's Fruit Garden; Black's Cultivation of the Peach, Pear and Quince, Fuller's Grape Culturist, and Moore's Orange Culture are recommended. Roe's Success with Small Fruits gives efficient directions for growing strawberries, raspberries, blackberries, currants, etc. In order to obtain good vegetables no better assistance can be found than from Peter Henderson's Gardening for Profit. All Henderson's books are boons to American gardeners, and this, the first, is in some respects the best; although intended more for market gardeners than for private places it is equally valuable for both. Vilmorin's Vegetable Garden, Burr's Garden Vegetables, and Oemler's Truck farming for the South make a very complete list, but for specialists there must be added such pamphlets as the New Onion Culture, Kalamazoo Celery, and Gregory on Squashes. I know of no good book on nurseries, nor is there one on hedges and hedge plants; the barbed wire fence has ended this once flourishing industry; the nurseryman who grows hedge plants should receive government protection from the cheap labor of the machine in the machine shops.

I will now ask your attention to a third and important class of books, namely, those which have to do with nomenclature, many of which also serve other purposes, giving cultural directions, the habitat, date of introduction, synonyms, and generally useful information about plants. The first and best of them is Nicholson's Dictionary of Gardening, almost indispensable to one who grows any great variety of plants, adopted, I believe, as the standard authority of names in this country by the Society of American Florists at their last convention. Some of you older men may prefer the Treasury of Botany by Lindley and Moore, but much more is obtained from Nicholson. To use either of these books, however, the name of the plant must be first known; if a new and unknown plant is presented it is not possible to identify it by the aid of these dictionaries; we must have recourse to a botany. For wild plants east of the Mississippi and north of Mason and Dixon's line the authority is Gray's Manual. Gray's Field and Garden Botany gives the commonest of the wild flowers within these limits, besides many cultivated plants; a new edition is now nearly ready which will contain some additions. Watson's Botany of California covers the plants of the Pacific slope, and Chapman's Botany of the Southern States includes plants not found in Gray. Every country has its floras, but these make a library by themselves, which is hardly possible for many persons to obtain. There is one book, however, within the reach of gardeners, which contains descriptions of a large number of cultivated plants; this is Loudon's Cyclopædia of Plants; with a little care and study it is possible to obtain from this the names of the older garden plants when other sources of information fail. The Linnæan arrangement is used, which is somewhat awkward to the novice, but this trouble can easily be overcome. Smith's Dictionary of Economic Plants gives much valuable information about such plants as are used in the arts or manufactures. Miller's Dictionary of English Names of Plants is a convenient reference book where the proper name is unknown or where the same plant is known under different common names in different places.

It seems hardly fair to ourselves to leave this matter of nomenclature without saying a few words about the changes in the botanical, as distinguished from the common, names of plants which is now going on. If the common names of plants were at all fixed, or if there was a possibility of ever establishing them, the changes in the proper names would not matter. It seems right that a protest should be entered in behalf of the gardener against these constant changes in the only names by which plants can be really distinguished. Is there not some right acquired by custom, by long usage, a trade mark as it were, by which a plant can keep its name? or is the name to be forever at the beck and call of any botanist who has time and inclination to hunt through old volumes and herbaria, and, finding that the first record of its discovery has been overlooked, correct the mistake by re-christening the plant wholly or in part? This renaming is a nuisance to the gardener when it affects plants in common cultivation.

There is a fourth class of books of practical use to the man who desires thorough equipment in garden lore, quite distinct from most of the titles given above, since they give no explicit directions for plant growing, but rather inspiration to grow plants. Among them, and this part of my list is curtailed, are Howe's Garden, as considered in literature by certain polite writers; Thistleton Dyer's Folk Lore of Plants; Ellwanger's Garden's Story; Sedden's Garden Craft Old and New; Blomfield's Formal Gardening in England; Mrs. Van Rensselaer's Art out of Doors, and Robinson's Garden Design and Architect's Gardens. Robinson's Parks and Gardens of Paris belongs partly here and partly among the books of a more technical character. These books, and many more of the same kind are good reading for gardeners; one need not do everything they find advised, nor take sides in the somewhat heated discussions on the merits of natural versus artificial treatments which will be found in Robinson and Blomfield; these books are full of suggestions, some of which can be carried out, some passed over, and others adapted to different circumstances and surroundings. An important type of garden literature has not yet been mentioned, and briefest consideration must suffice for the present; I mean the horticultural journal of the present day. Our gardening papers are so good that books are likely to be overlooked; in them we find the very latest intelligence about new introductions and improved methods of cultivation; for one important subject, the diseases of plants, vegetable pathology, the papers are almost our only source of information. That at least three new journals devoted to general gardening have established themselves upon a firm footing within the last few years in this country is sufficient proof of their importance in practical plant growing. The large circulations and replete advertising columns of the trade journals indicates their usefulness and success.

LIST OF BOOKS RECOMMENDED BY PROF. WATSON.

1. GENERAL:

Lindley: The Theory and Practice of Horticulture. English.

Loudon: Encyclopædia of Gardening. English.

DISPLAY OF CYCLAMEN BY GEO. M. ANDERSON AT THE SPRING EXHIBITION OF THE MASSACHUSETTS HORT. SOCIETY, BOSTON.

Decaisne et Naudin: L'Amateur des Jardins. French.
Thompson: The Gardener's Assistant. English.
II. SPECIAL:
a. Soil;
Johnson: How Crops Grow.
How Crops Feed.
Storer: Agriculture.
Harris: Talks on Manures.
Waring: Drainage for Profit and Health.
Stewart: Irrigation for Farm, Garden and Orchard.
b. Plant life:
Gray: Structural and Systematic Botany.
Goodale: Physiological Botany.
Sachs: A Text-book of Botany. German, translated.
c. Propagation;
Burbidge: The Propagation and Improvement of Cultivated Plants. English.
Bailey: The Nursery Book.
Jenkins: Art of Propagation.
Fuller: Propagation of Plants.
Baltet: Grafting and Budding. French translated.
d. Cultivation under glass.
1. Building plant houses.
Taft: Greenhouse Construction.
Fawkes: Horticultural Building. English.
Woodard: Graperies, etc.
2. *Tender plants.*
Henderson: Practical Floriculture.
Hunt: How to Grow Cut Flowers.
Williams: Choice Stove and Greenhouse Plants. English.
Orchid Grower's Manual. English.
Burbidge: Cool Orchids. English.
The Chrysanthemum. English.
Morton: Chrysanthemum Culture for America.
Falconer: Mushrooms and How to Grow them.
Rivers: The Orchard House. English.
e. Cultivation in the open air.
1. Planning and laying out.
Andre: L'Art des Jardins. French.
Codman: See list of books on landscape gardening. *Garden and Forest*, vol. III, p. 131.
2. *Trees and shrubs.*
a. For ornament.
Du Breuil: Culture des Arbres et Arbrisseaux. French.
Koch. Dendrologie. German.
Lauche: Deutsche Dendrologie. German.
Koehne: Deutsche Dendrologie. German.
Dippel: Handbuch der Laubholzkunde.
Ellwanger: The Rose.
Reynolds Hole: A Book about Roses. English.
Rand: Rhododendrons.
b. Forestry.
Hough: Elements of Forestry.
Jarchow: Forest Planting.
Fuller: Practical Forestry.
Descars: Tree Pruning. French translated.
c. Fruits.
Downing: Fruits and Fruit trees of America.
Barry: Fruit Garden.
Black: The Cultivation of the Peach, Pear and Quince.
Fuller: Grape Culturist.
Moore: Orange Culture.
Roe: Success with Small Fruits.
3. The flower garden.
a. Herbaceous plants.
Robinson: The English Flower Garden. English.
The Wild Garden. English.
b. Bedding plants.
Henderson: Gardening for Pleasure.
Robinson: The Sub-Tropical Garden. English.
Gleanings from French Gardens. English.
Allen: Bulbs and Tuberous Rooted Plants.
Mrs. Loudon: The Ladies' Flower Garden. English.
John Robinson: Ferns in their Homes and Ours.
4. The kitchen garden.
Henderson: Gardening for Profit.
Vilmorin: The Vegetable Garden. French translated.
Oemler: Truck Farming at the South.
III. NOMENCLATURE AND REFERENCE.
Nicholson: Dictionary of Gardening. English.
Lindley and Moore: Treasury of Botany. English.
Gray: Manual of Botany.
Field and Garden Botany.
Loudon: Encyclopædia of Plants. English.
Smith: Dictionary of Economic Plants. English.
Miller: Dictionary of English Names of Plants. English.
IV. MISCELLANEOUS.
Howe: The Garden. English.
Thistleton Dyer: The Folk Lore of Plants. English.
Ellwanger (G. H.): The Garden's Story.
Van Rensselaer: Art out of Doors.
Robinson: Garden Design and Architect's Gardens. English.
Parks and Gardens of Paris. Eng.
Sedden: Garden Craft Old and New. English.
Blomfield: Formal Gardening in England. English.

Cyclamens.

Our illustrations represent—not as clearly as we would wish, however—the exhibit of cyclamens made by Geo. M. Anderson of Milton, Mass., at the spring show of the Mass. Horticultural Society. Mr. Anderson's cyclamens have been famous about Boston for some years, and those exhibited on this occasion were pronounced by good judges to be the finest ever seen in this country. Flowers of the white variety represented in our illustration of a single specimen measured 2½ inches long, or 5½ inches from tip to tip of the expanded petals. In response to our request for a few lines on cyclamen culture, Mr. Anderson sends the following practical to-the-point notes:

"Taking into consideration the fact that most of the readers of the AMERICAN FLORIST are men who are well posted in the general care and treatment of such plants, it is, I think, needless to go into all the little details, so I will give you merely a brief outline of a few things I do which I believe are not generally done.

"I grow my plants in a greenhouse all summer; I can attend to them better and get right in with them and see what they want.

"I do not believe in shading with racks; even if the midday sun should cause the plants to wilt a little, they require the light. I shade very lightly with lead and kerosene the first of the season, applying a second coat as the season advances.

"I believe in using rich compost from the start, making it a little richer at each shift. My compost is good turfy loam and cow manure, as rough as the size of the pot will allow and a liberal supply of bone meal and charcoal. I never use liquid manure, not because I think it would hurt them, but for the reason that I think good rich soil from the start, good drainage and an occasional watering with lime water is better.

"In carrying over the bulbs the second year I like to ripen them just enough so

that they have still a few green leaves left on them when they commence to grow."

A correspondent who visited the greenhouses where Mr. Anderson has charge wrote us a few weeks ago as follows:

"The glory of the place was the cyclamens, and they were attracting all sorts and conditions of flower lovers and dealers. Mr. Anderson may well feel proud of his plants; they are the finest ever seen around Boston or anywhere else. One house contained 5,000 plants and were a sight that one cannot forget. Some 30 plants of the best reserved for the March exhibition in Boston will show for themselves to what perfection the cyclamen can be grown as a decorative plant. A written description is of little use in trying to describe those plants and flowers; they ought to be seen to get anything like an idea of their gorgeous beauty.

"Another feature of the place, and not one of the least, is the mushrooms, for which it is noted. From beds under the benches in two houses $500 worth had been sold the past winter. In two old silos fitted up with many benches for beds and heated with boiler and pipes the mushrooms were innumerable; some of the later made beds had not yet begun to yield. Mr. Anderson has no donbt but 5,000 pounds will be gathered as the season's crop by the time the beds give out in the warm weather."

Carnation Notes.

Indoor carnations will now be requiring plenty of water and constant attention to the syringing, so that the spider does not get a start on the plants. If they are badly crowded, as they are liable to be at this season, it will pay to thin them out either by thinning the plants themselves or pulling some of them out entirely. A good plan to keep them in good healthy shape is when you are cutting the flowers to cut well down into the plant and get a good long stem and thin the plant at the same time.

If you find the flowers are not coming up to the mark, a little manure water given them twice a week will help them out all right. You will want as good or better flowers than you have been cutting all winter, because you have not only a probable extra supply of carnations to compete with, but the spring flowers will be coming into the market and you must have good flowers to hold up your end of the trade.

Do not let the plants get crowded by weeds, and give them plenty of ventilation. When the temperature does not go below 50° at night outside it is best to leave the ventilators open all the time day and night. Attend to the disbudding; in short give the plants all the attention they need, and whenever it does not pay to grow them right throw the plants out; in some places they will pay all summer, others they will not pay after the first of May.

When the sun begins to get very hot, give the houses a light coat of shading; they will then require less watering and less attention all around, and your flowers will hold better. After May 1 the flowers should be pulled daily to put them on the market in good condition, and they should be put on in no other way.

Some florists advocate the taking off of either all or part of the glass during the summer, but they might as well be outside entirely, as every rain will injure the flowers to a greater or less extent. The houses should have an abundance of ventilation, but the roof should be on to keep out the rains and winds.

There is no question from now on but that benches are not in it with solid beds; the difference in favor of solid beds is as marked as day and night. In fact I shall stick to my solid bed system for most varieties, as by very careful comparison the season through I am convinced that better results can be had from solid beds. The flowers are better and possibly five per cent more of them, the great gain being in their quality. The plants are always so nice and clean and vigorous in the solid beds that they are a pleasure to look at. I can't say as much for the benches, although from what I have seen in other places mine are doing as well as the average bench carnations. Whether it is in my soil or what it is I would not attempt to explain, but those are the results looking backward, and looking forward there is prospect of a fine crop of good bloom for an indefinite period yet. When one is growing nothing but carnations he is not anxious to see the season close too early and I am satisfied that my benches will not pay for their care after May 1. My case may be an exceptional one, but I don't think it is. However, if you are having good results from benches, don't follow the old proverb "What is good for the goose is good for the gander." That does not apply to carnation culture; every one has to study his own soil and conditions. ALBERT M. HERR.

Carbolic Acid for Carnation Rush.

ED. AM. FLORIST: We can attest to the efficiency of carbolic acid as a remedy for carnation rust. A 1% solution thoroughly applied will destroy all rust with which it comes in contact in two applications. Such is our experience with some badly affected stock. We believe that in advanced stages of the disease the acid will prove an effective agent in checking any further spread of the same. We have not used any of the popular remedies and judge from the conflicting reports that they can not show very decided results.

For young plants in pots or flats would advise a weaker solution, as unless very carefully sprayed the roots might be damaged by the soil taking up too much of the acid. The 1% solution is not in the least injurious to young foliage, and only a few blooms (Daybreak) were damaged.

Our practice was to cut the flowers close, then syringe thoroughly from all sides, using the *finest spray possible*. We think a practical method would be the occasional use of the 1% solution to be followed by weekly applications of some of the milder remedies, as we would expect injury to roots of plants in benches or beds if this stronger solution were continued without intermission. No fear need be entertained in making one or two applications of the 1% solution to plants in beds or benches; as to the effect on flowers, we can only speak of Daybreak and McGowan, other varieties might suffer more.

The U. S. Dispensatory, 13 Ed., says of carbolic acid: "But by far the most important property of carbolic acid, both as a therapeutic and preventive agent, is its destructive influence over the lower grades of organic life, whether vegetable or animal. In a solution containing only one part of the acid in 500 of water, it instantly destroys vegetable mould, both plant and spores, and operated with equal destructiveness upon minute or microscopic animalcules."

Apropos to the subject, why do some of the leading dealers persist in sending out affected stock? "infested" would be descriptive of some. One of the novelties received was full of it, another, badly affected, a third had leaves trimmed carefully. We presume it is too much to expect that such valuable stock be discarded, nevertheless it is exasperating, to put it mildly, to the grower who has "fired" a lot of affected plants, to receive high-priced novelties that are in a worse condition than the stock thrown out. To send plants back to the shipper is one recourse though not a satisfactory one.

Glenfield, Pa. BECKERT BROS.

Mrs. Fisher Carnation.

It is with surprise that I see this grand white carnation being dropped by growers all over the country. Here it is decidedly the best white we have for profit. The photograph I send you is from a house that has been in full bloom since Sept. 15 and is to-day Feb. 1st, looking about the same as at any time during the season.

[The photo was not sharp enough to make a good engraving. The picture showed a house with a very heavy crop of bloom.—ED.]

With this variety be sure to select cuttings from nothing but the very choicest plants and it will improve every year. Many complain that it makes too many short stemmed flowers, but I found that after being slightly improved by careful selection we got no short stemmed flowers at all and no bursted flowers except a *few* during Jan. and Feb. The size is all that can be desired (2½ to 3 inches) and the stem is generally stiff enough to hold flower erect. All my flowers this winter have been cut with stems averaging over 12 inches and some 18 and even 20.

My manner of handling is as follows: The choicest plants are selected at planting time (Sept. 15) and planted separate. After Christmas crop is cut we overhaul and cut out all but the choicest wood, again tying up carefully. Feb. 1st to 15 we put in our cuttings and only from pure white, long, stiff stemmed flowers. I have none to sell. CHAS. POMMERT.

Greenfield, O.

Carnation Grace Wilder.

I have yet to be convinced that there is a better carnation in existence to-day than Grace Wilder, well grown. Notwithstanding the frequent condemnation which it receives and the praise given to the newer sorts, I must say that I do not want any better flowers than I get in Grace Wilder grown as it is being done this season by John Reid of Jersey City, and in color it certainly cannot be beat.

New York. GEO. M. STUMPP.

WE HAVE RECEIVED from Mr. H. Taylor, Dunkirk, N. Y., a sport from Buttercup carnation which shows a strong departure from the parent plant. It is pure white, strongly streaked with carmine down the center of each petal, and a few flakes on the edge. Since the advent of Helen Keller we can hardly say that the striped varieties do not take in the trade, and the one under comment is certainly an attractive flower, with good fragrance.

SPECIMEN WHITE CYCLAMEN. GROWN BY GEO. M. ANDERSON.

CRIMSON SPORT is a new carnation, originating with J. L. Dillon of Bloomsburg, Pa. The flower is a good size, deep velvety crimson, and the blooms sent us were in fine condition after their journey. They appear to hold their color without blackening very well.

Azaleas, Primroses, Cyclamens, Ipomæa, Crinums.

A subscriber from Newark, N. Y., wants to know the best way to carry over azaleas for another year. This subject has been often written up in your columns and by none better than Mr. James Dean in his paper read before the Society of Am. Florists in Boston, in August, 1890. My method is as follows: With all plants unsold, or with those I did not want to sell the first year of importing, I place in a temperature of 55° to 60° at night in the month of April. About this time they are making their growth for the following season's flowers. Keep them well syringed daily and never let them wilt for want of water. When they are making their growth in the spring is the time to do the pinching which is necessary with some of the shoots to get them into a compact, neat form. About the end of May choose a place to set them outside where they will never be troubled with water under the pots. Surround the pots with some material such as tan bark, spent hops, coal ashes or any material that will keep the sides of the pots covered so that evaporation does not go on too rapidly. This is I think much better than plunging them in the soil. Never let them suffer for water during the summer, and in the hottest weather they will need watering twice a day; syringing with hose will always do them good. Let them be fully exposed to the sun when plunged outside. Bring them into the houses before there is any danger of frost. The best soil for azaleas is a good light loam with one-third or one-half real leaf-mould, and a little sand added. If they are imported plants and have been properly potted when received they will need no more pot room for at least 3 years. They are very slow to take hold of the new soil. Where large quantities are handled they can be taken out of the pots in May and planted in some rich soil and the surface mulched with hay or straw. They will need less attention during the summer than those kept in pots, and we are all aware how easily and with what little harm they can be lifted and potted in the fall, but then you have the extra labor of potting again in the fall.

Another question is also referred to me from Burlington, Ia. "Practical instruction how to grow primroses and cyclamens" are wanted. These subjects have also been well ventilated in your paper but the knowledge of one who has been moderately successful with the above popular plants will perhaps bear repetition. To have primroses in flower in mid winter, and then is when they sell best, sow the seeds about the end of May. Sow carefully and cover very lightly and place the seed pan in the coolest place you have in your houses. In about 5 weeks they will be ready to go into a 2-inch pot. If you don't have a house that heavily is shaded, with plenty of ventilation, then place the little plants in a cold frame with the sash raised back and front, and plenty of shade. In August they will need a 3-inch pot and in October or early November they can go into a 5-inch, or if not a very strong plant, a 4-inch. When dark weather comes on they will need the lightest house and cool, about 45° at night is just right. At the last shift get them low enough down so they are not shaky at the neck without getting the crown covered. This will obviate the need of sticking toothpicks round the crown to keep them upright, as I have seen them doing in England. Avoid in the soil anything of a heavy or close nature; plenty of leaf-mould and loam and good drainage. The primrose family is not troubled with either aphis, red spider, thrip, mildew, or any other of the many enemies to which so many of our cultivated plants are heir. One of the most important points of primula culture is to get good seed. The great bulk of the seed offered to the trade is rubbish and not worth the time spent in its growing. Take pains to get a good strain.

Cyclamen persicum and its improved varieties is now a very popular plant, as it deserves to be. It is invariably a satisfactory plant in a dwelling house. The seeds should be sown anywhere from October until January. The earlier you sow them the larger the plants can be grown by the following winter. As soon as the first leaf is perfectly formed and the little bulbs are the size of small peas, transplant into 2-inch pots and keep growing in a night temperature of 50° to 55° and plenty of light. When they have made good roots in the 2-inch shift into a 3-inch. In the 3-inch put one inch of broken up charcoal for drainage. If you wish to have the largest plants that can be grown in the time, you can in May or June make a mild hotbed and plunge the plants in some good material in the hotbed, keeping the shaded sash raised back and front so that there will be plenty of air over them all the time. In September they should be taken into the house and should then get their last shift, which must be according to the wants of the plants; a 5, 6, or 7-inch is the most useful size. Well grown plants in 5-inch pots are the best for market. It is absolutely necessary that cyclamen be well drained and charcoal will be found as cheap as anything. A good loam, not too light, with a fourth of well decayed cow manure and a little old pounded up mortar, will grow them well. Just before flowering weak liquid manure will help them very much. At all stages of their existence while growing, a light dusting with the syringe is most beneficial, and unlike the primrose they are troubled greatly with greenfly, so they must be kept constantly and regularly "smoked." In the winter they don't like a cool damp house; 55° at night is about right, in a clean dry atmosphere. Cyclamen are troubled with a rust on the leaves and the way to prevent it is to keep them in a healthy growing state. If you have not sown seeds this past winter, purchase some young plants from some good grower for next winter's sale.

From Bethlehem, Pa., comes the query "how to start Ipomæa Mexicana." I am not acquainted with the species. It is one that will no doubt flourish in our summer months out of doors. Start the tubers in small pots of light soil and in June plant against a lattice or some support in a sunny sheltered position.

From Newark, N. Y., comes the question "How to treat crinums in pots." They should be given plenty of pot room, a 12 or 15-inch is not too large for a good plant. A lumpy mixture of good loam, sod, and peat if you can get it, and a good addition of broken charcoal, all mixed together is a compost that they will thrive in. Spring is the best time to repot or divide them. During the summer they delight in the high temperature and should be copiously syringed. After they have flowered water should be withheld during their resting period, which is winter time, but not enough to cause the leaves and bulbs to shrivel. When not convenient to give them a larger pot or tub they should receive a rich top dressing in the spring and liquid manure during the summer. WM. SCOTT.

Two Little Mistakes.

Having this past season had an experience with two articles, one a fertilizer and the other an insecticide, it appears to me that I may be the cause of preventing others from falling into the same mistakes. As they both occurred on my own place there is no theory or hearsay about it, and here they are:

Having used nitrate of soda in liquid state on roses and other plants with apparent good results, I thought last fall I would try some in its natural state on carnations. I was planting a house of the same, the variety was Grace Wilder. I used no animal manure of any kind as I

was late and had no chance to get any, for which from the way the carnations have grown and flowered I have nothing to regret. In place of the manure I dusted the soil as it was brought in with bone dust. Having some nitrate of soda on the place, I left one space between iron supports, about 8 feet by 6, holding perhaps 75 plants, and on this space put about 2 quarts of the soda and raked it in. I was careful to confine it to exactly a defined line because I wanted to see the result, and on that space I put no bone dust. Two weeks after planting the Grace Wilders began to turn brown and in two months they were dead, while on each side of them the carnations were growing as healthy carnations should grow. I was not at all vexed over this, in fact I was much pleased, for I consider I got off very cheap, and this little space 5x6 may have saved me many dollars.

The other experience was with Fostite and violets in November last. I had a bench of violets, Marie Louise. They were not the premium plants of the country but they were picking up fine and would no doubt have been a source of profit to me, when in an unlucky moment a youth (my own) who had been dusting carnations with Fostite, from the fertility of his brain and without orders thought the violets would be benefited by a dose of Fostite and so they got it. It was a good heavy dusting but nothing more than would be perfectly harmless to carnations. It killed every leaf dead and where it reached the heart it killed the plant. In two days a perfume pervaded the house which was not the sweet odor of violets but of decayed vegetables. It is simply death to violets. This is the more strange because I have found Fostite the best and easiest applied of all antidotes for carnation rust and it does not do the slightest harm to the plants in any way. WM. SCOTT.

Philadelphia.

G. E. Luffmann, of Chestnut Hill, has sold out his establishment to Irwin McCallum, who will remove the greenhouses to Ambler, Montgomery Co., where the business will be carried on in the future by Mr. McCallum, with Mr. Luffman as manager. Additional glass will be erected from time to time as it is the intention to grow flowers in quantity for the trade. Carnations will be the leading feature for next season. Mr. McCallum is a wealthy manufacturer and has abundant means to carry out his ideas.

The early part of the past week was very disagreeable, there were violent winds, rain, snow and sleet, and taken all together old Probs. could not have done much worse. Friday and Saturday the skies cleared, the weather was fine and the week wound up with two busy days. "Suppose this weather had come two weeks ago," was a remark that made many interested parties send up a little silent prayer when they thought of what might have been.

Prices of stock remain much the same as last week with the exception of carnations, which have dropped a half cent and are now $1.50 per hundred for good ordinary; the fancies still retain the old prices however, the growers of these having apparently formed a sort of trust or mutual agreement society. Sweet peas too, are down a little, the best being $2 per hundred, and as they are becoming quite plentiful this figure may not last long.

In blooming plants the cold frame forget-me-not has made its appearance and sells well. J. Westcott has some very pretty English primroses, the best we have seen. There are still a few genistas, hydrangeas, daisies and lilies left from the Easter stock; these with pot geraniums and roses about make up the list.

Hyacinths and tulips are now in full bloom outside and beds of these in the lawns, which have just had their first clipping, are sure indicators that spring has arrived.

There was a meeting of the trustees last Friday afternoon to confer with the gentlemen who are anxious to furnish the money to rebuild Horticultural Hall. Some of the trustees, on account of an offer of $300,000 which they have had for the property, opposed rebuilding; they think they can with this capital obtain for the society a library building and meeting room and in addition an income of $10,000 annually, which, with the dues of members and the admission fees of the exhibitions, the society would be established on a sound financial basis and better able to advance the work of horticulture and floriculture than ever before. There is to be a meeting of the society in which the matter in all its bearings is to be discussed, as the trustees do not wish to refuse the offer they have unless the proposition to rebuild has the endorsement of a large number of the members of the society.

Robert Craig says there is a disease among the kentias; that they are dying outright or in part; a plant will be found all dried and shrivelled as if it had been frozen, while in some cases only a leaf or two is affected. The disease is not believed to be contagious and but little is known about it, as it has only recently made its appearance.

A carnationist in speaking of his plants recently said that early in the winter, he noticed that in one of his houses the plants seemed crowded and the flowers were getting small and weak stemmed. As an experiment he removed every other row across the bench. An improvement was at once noticeable and during the balance of the season his best stock has come from this house.

Walter Cliffe, son of David Cliffe of Germantown is about building a range of houses near 53rd and Market Sts. K.

Chicago.

The season for the sale of cut flowers is fast drawing to a close, still with us in the west at least there remains about two months more in which we might expect to do a fairly active business, in fact the spring months and up to about June 20, was once considered the most profitable season for the retail dealer, and for that matter the growers also. But things have changed somewhat in the last four or five years. The spring trade in the cut flower line is not what it used to be. As to the cause, opinions seem to differ. Many of the dealers attribute the falling off of trade in the legitimate channels to the fakir, who undoubtedly is at this season of the year most active. There is no doubt but what the Greek, in multiplying numbers with each succeeding season, is making his presence felt more and more as quite an important factor in the market, yet others trace the cause of the diminishing spring trade to the fact that the society season is closed now-a-days at an earlier date than was the case in former years. Whatever the cause the fact remains that the dealer cannot rely in a very large degree on the remaining six or eight weeks.

Trade last week was very dull, particularly as regards the demand in the city. A fairly active shipping trade is reported by the wholesale men, but this proved entirely inadequate to absorb the enormous number of roses that all of a sudden have swamped the market. Every grower seems to be on with a full crop; whole wagon loads of stuff are dumped on the market, causing a glut such as hasn't been noted for many a day. Prices of course are away down. Mermets, Brides, Perles, La France and Woottons are offered at $15 to $20 per thousand, and few buyers at that. A few extra lots sell at a point or two higher. Meteor goes at $2.50 to $3, if select. Jacqs are down to $8 for the best, 5 to 6 for seconds. Hybrids 12 to 18; the latter figure is paid for very fine Brunners and Baroness Rothschild. Beauties hold their own at $25 for selected long stems, $18 for good seconds. Beauties, by the way, have improved greatly the last week or two; some of the flowers sent in now are really fine.

Carnations, except white, are plenty but not overstocked. The latter is still scarce. Common sorts, colored, are quoted at $1, white 1.25. Daybreak brings $2, and Buttercup of which a few fine blooms are offered, sells at $3.

Harrisii are slow at 4 to 6, Romans $1.50, valley 2 to 3, violets 75c to $1, mignonette 1.50 to 2.

Sweet peas are coming in quite freely, mostly of the Blanche Ferry and Nellie Jaynes variety. These meet with ready demand at 1.25 to 1.50 per 100.

Owing to a clerical error the meeting of the stockholders of the Cut Flower Exchange last Friday came to naught. The call should have been made for an adjourned meeting, but instead was made for a special. Under the by-laws a ten days notice is required for such a meeting and as only five days notice had been given no legal action could be taken to wind up affairs as had been intended, so an adjournment was taken subject to a call in legal form. There is no doubt that the exchange in its present form will go out of existence on May 1. All the members however who have done business on the exchange heretofore, with the exception of the commission men, will reorganize and start up again. A room large enough to accomodate the present membership has been secured on the second floor of Nos. 61 and 63 Wabash avenue. The business will be carried on in the same manner as before but under a different title and with the elimination of the commission feature. Growers only will be allowed to do business.

T. J. Corbrey has gone to California on a four weeks pleasure trip.

J. T. Anthony will move to 2114 Michigan avenue about May 1.

At the last meeting of the Florist Club little but routine business was done. In view of the dissolution of the Cut Flower Exchange the trustees of the club were instructed to arrange for new quarters. Mr. J. T. Anthony offered a large room in connection with his store on Michigan Avenue, which would be very desirable were it not so far south. The trustees will probably ask that the final selection be made by vote of the club at the next meeting and it is hoped that the attendance will be large and a full expression of opinion had. It was decided that when the club takes possession of the new quarters, wherever they may be, there should be an old fashioned house-warming and a good time.

There were not sufficient to make a quorum at the last meeting of the Horticultural Society, but matters connected with the coming chrysanthemum show

were discussed informally, and a meeting of the executive committee will be called at an early date to take final action regarding a place to hold the exhibition.

Mr. John Speelman, of C. J. Speelman & Sons, Sassenheim, Holland, was a recent visitor.

Boston.

Trade in general has been very quiet with the florists during the past week. The weather has been the worst of the season and seems to have put a damper on everything. There is considerable stock of inferior quality on the market and this goes slow. The best demand is for first-class Jacqs, Brunners and other large roses and whatever is offered in this line goes readily.

Mr. W. H. Manning was awarded a first-class certificate of merit for a new yellow-barked Osier Dogwood (Cornus stolonifera, var. aurea) which was recently found at Stockbridge. It makes a fine contrast with the common red-barked variety and as such will undoubtedly become valuable.

The bowling enthusiasts of this neighborhood are beginning to talk business regarding the prospects for Atlantic City next summer. A good team is sure to turn out on that occasion.

A. W. Bennett of Schenley Park, Pittsburg, Pa., and George C. Watson of Philadelphia have been in town. We hope they will both stay longer next time.

New York.

The Morgan-Hamilton wedding which took place on April 12th, the bride being the daughter of Mr. J. Pierpont Morgan, was undoubtedly the leading society event of the season, and the floral decorations by Thorley at St. George's church and at Mr. Morgan's residence were correspondingly magnificent.

At the church the spacious chancel was turned into a perfect garden of lilies, hydrangeas and lofty palms, the railings being heavily decorated with asparagus, white roses, lily of the valley and other white flowers in profusion. On the pew ends down the whole length of the center aisle were large clusters of lilies, hydrangeas and hybrid roses fastened with bows of white ribbon, and the font was a great mound of marguerites. The interior of the church being of dark wood and the floral decorations confined almost entirely to white, every flower showed for its full value and the effect was very striking.

The decorations at the house were marked by an entire absence of lilies or hydrangeas. One of the prettiest combinations was seen in a recess in the main hall where the frame of a large picture was covered with daffodils and the foreground and corners were massed with genista plants which arched over with beautiful effect. The staircases were richly trimmed for three stories up, each newel supporting a large cluster of long-stemmed American Beauties and the carved balustrades heavily decorated with masses of these and other large red roses.

The sides and top of the entrance to the reception room were thickly covered with Baroness Rothschild roses. At the end of this room, where the bridal party received, a curtain of asparagus, Mabel Morrison and Bride roses and white lilacs, caught up at one side with white ribbon, was the main feature, while the bay window in the center across from the entrance was arranged similarly excepting that Jacqs and crimson ribbon were used instead of white. The fireplace and mantel at the other end were filled with white rhododendron and azalea plants. Wherever available, festoonings of smilax and asparagus were freely used.

The bride's bouquet was made of white sweet peas and Phalænopsis amabile, small clusters of these same flowers being also fastened on the bows of broad white ribbon with which it was tied. The bouquets for the six bridesmaids were of lilacs, three purple and three white.

There is no scarcity of weddings this season and all the florists are having their share of the decorating work. There is nothing specially new or novel that can be said to be characteristic of these occasions this season, the only generally prevailing feature being a disposition to economize. Customers have got into a bad habit of going from one florist to another canvassing for low figures and many complaints of rate cutting are heard.

Bouquets for weddings are made rather large but there is no limitation as to the material that may be used in them, the flowers of which they are composed varying with the tastes or whims of the parties interested. In one case Mabel Morrison for the bride and Baroness Rothschild with mignonette for the bridesmaids were used; in another lily of the valley for the bride, while the bridesmaids carried tall clusters of longiflorum lilies laid up against the arm, in so called Grecian style; on another occasion the bride's bouquet was of Bride roses and the bridesmaids' of Bridesmaid roses. Occasionally a very eccentric fancy is displayed, as where a gentleman recently ordered a bridal bouquet of white camellias made in the old fashioned style and would take nothing else. In such instances the florists have learned not to question or to offer advice but to go ahead and do the work as directed, no matter how absurd.

Southern palm leaves are pretty extensively used as back grounds, and festooning of laurel is occasionally used where much is wanted for little money. Asparagus is the material most in demand however for such work. Sea green ribbon is very generally used to fasten these festoons. Wreaths of Southern galax leaves, sometimes in combination with roses, etc., are used indiscriminately for both weddings and funerals. Where it is desired to shut off a part of the space in a church for special uses the reserved portion is designated by a festoon of roses or ribbon across the aisle, or a pair of tall palms are placed so that the leaves form an arch overhead.

The wholesale cut flower trade is in somewhat better shape than at time of last report, the long spell of dark and stormy weather having shortened up the crop so that it is scarcely equal to the demand. Prices continue low in spite of this; it is a hard job to restore prices after they have once gone down; the retailers resist anything of this sort with remarkable unanimity. Harrisii lilies are sold cheaper than ever before, $20 to $30 per thousand being the prevailing figure and they are not all sold, even at that. There are indications of an approaching scarcity of smilax. Wiegand Bros. are sending in La France roses now, the equal of which it would be difficult to find. Moss roses are coming in from Ernst Asmus and Julius Roehrs.

Mr. I. Forsterman was the recipient on April 8th of a handsome gold watch and chain which was presented to him by the Schwaebischer Saenger Bund of Brooklyn, an organization of which he is a member.

Thos. W. Weathered's Sons have secured a contract to erect a fine range of greenhouses for Mr. E. T. Bedford, Green's Farms, Conn.

Mr. Charlie Carlin, Thorley's indispensable buyer, is receiving congratulations on the birth of a daughter. On being asked how he felt about it his reply was "Oh, that's not bothering my head much; third wife, you know."

Captains of nursery or florist's nines and others interested in base ball can now arrange dates with a crack New York aggregation by addressing John Skelley, care of Thos. Young, Jr., 20 West 24th street.

Lorenzo R. Brower of the firm of W. H. Brower & Sons, Broadway, will be a married man by the time this gets into print; Wednesday April 18th, is the happy day.

Thorley is enlarging his facilities by moving his offices up one story above his store.

P. B. Meissner of Flatbush is sending fine plants of calceolaria to the New York market.

Washington.

The annual business meeting of the Washington Florist Club was held April 4 in their new and comfortable quarters, No. 716 6th street, N. W. The first business transacted was the election of officers resulting as follows: President, Wm. H. King; Vice-President, Robert Lacey, of the firm of Kramer & Lacey, of Anacostia, D. C.; Secretary, Geo. W. Oliver; Treasurer, Adolphus Gude; Corresponding Secretary, Wm. F. Gude. This meeting was well attended. The advisability of holding another chrysanthemum show this coming fall was brought up and thoroughly discussed by all present. Mr. W. A. Manda, of South Orange, N. J. being present, was requested to address the meeting on his experience in running a chrysanthemum show. He gave a very interesting talk on the subject, which was thoroughly appreciated by all present. Mr. Manda is a great believer in shows and said they were the life of all clubs; that that was the principal purpose of their organization. The majority of those present were in favor of holding a show, but a decision was ultimately postponed until a future meeting. Mr. Fred Atkins, representing Pitcher & Manda, looked in upon us. In the basement of this new hall is a fine bowling alley, which is a great attraction to many of our boys. After the meeting they invited Messrs. Manda and Atkins below to take a turn at the pins, where several hours were very pleasantly passed.

Mr. A. W. Bennett, Supt. Schenley Park, Pittsburg, spent Saturday and Sunday in Washington. He is on his way east in the interest of some special improvements in the park in the way of an electrical fountain.

The cut flower trade has hardly been up to the standard. Society people are keeping rather quiet since Lent. Roses are more plentiful and of better quality.

The boys are all very busy preparing for the spring trade in bedding stock. The market florists have been kept quite busy the past week. The demand for plants in bloom has been very good while the demand for decorative plants, palms, dracænas, rubbers, etc., has been fully up to the growers expectation. Should the weather moderate and get a little more spring like, the growers will be kept on the jump for the next few weeks.

Mr. Geo. H. Brown, Supt. Public Parks,

is a very busy man just now preparing plans for the planting of the beds in the various reservations. This season he proposes to use more tropical and subtropical plants than has been the custom heretofore. He is asking Congress for an appropriation for the purpose of erecting a house 20x120 feet in which to grow more tropical plants for bedding. This house will be erected during the summer and will be devoted exclusively to tropical plants for the parks. The new French cannas will be a feature in the parks this season. Flowering tobacco is also to take a conspicuous part. A few of those plants were used last season with good effect. The variegated bananas will form the centers of a number of beds. The newer and better varieties of sunflowers will be used extensively, also the best of the ricinus, and grasses, particularly the three varieties of eulalias will be used in quantity. In the shady parts of some of the parks new beds will be cut and planted with such plants as crotons, pineapples, dieffenbachias, caladiums, dracænas, begonias, etc. Every inch of space in the houses under Mr. Brown is being rapidly filled with small bedding plants from their propagating houses. It requires hundreds of thousands of these plants every spring for the parks. Mr. Brown proposes to make a number of beds in designs complimentary to the Knights of Pythias who are to visit Washington this summer. They will be emblematic, representing their badges and insignia, something after the same manner of those made two years ago in compliment to the Grand Army. They will not use as many echeverias this season as they have done the past few years. The fountains will be filled with nymphæas and other aquatics. REYNOLDS.

Buffalo.

Business could be called only very moderate if it were not for funeral work, of which there has been a good deal of late, and as that class of work is always well distributed it helps everybody in the trade. We cannot complain of that great surplus of flowers which the large eastern cities speak of, yet all flowers are getting plentiful. Violets are growing beautifully less every day in size if not in quantity. Roses are fine just now. There are a few dozen "Belles" sold in Buffalo every day. You don't hear as much of this rose as last summer. You hear occasionally that it is "disappointing," "no improvement over Beauty," etc. Although merely a sport, or, to speak correctly, a bud variation of Beauty, it is very different in many respects. The leaf is distinct from Am. Beauty. When at its best the flowers have almost as beautiful a color as La France. A heavy full flower, and my experience with 500 plants this last winter is that the Belle will give you more flowers under the same conditions than Am. Beauty, and a dozen perfect flowers of Belle will sell before the Beauties. To think it a less vigorous grower than Am. Beauty is a fallacy; it is just as strong a grower.

On Tuesday we were visited by 18 inches of snow. It was a great blizzard for this time of year, but did no harm, and the bluebird and daffodil are again twittering in the garden in their respective places.

Sebastian Pickleman, after a winter's hard work, is going to take a good holiday. Californin and old Mexico will be thoroughly explored.

Mr. Stewart is receiving some great roses from Harry Dale and they are now talked about on the street. His Mermets, Brides, Wootton and other varieties are certainly wonderful and it is a sad fact they are not equalled on this side of the Niagara wherever you go. What can it be? It can't be climate and it ought not to be brains (Mr. D. will excuse me I know); it must be soil. Whatever the means to success, the roses are phenomenal. W. S.

MEDIA, PA.—The real estate of La Roche & Stahl under the trust judgment will be sold by the sheriff, in this city, at 10 a. m., April 28.

MINNEAPOLIS, MINN.—F. C. Bartels, for six years foreman for J. M. Gasser, Cleveland, is now foreman of the Mendenhall Greenhouses, this city.

DENVER, COL.—Easter trade was about 25% larger than last year, with prices about 25% lower. Supply ample. Quality not quite so good. Increased call for red roses, valley and violets.

SITUATIONS, WANTS, FOR SALE.

A RARE CHANCE FOR INVESTMENT

FOR SALE.

Columbia Farm, containing over 20 acres arable and grazing land, climate one of the finest in the world. Frost and malaria unknown. Lilies, narcissus and amaryllis grown in open ground throughout the winter. Enough Harrisii and other Bulbs will be furnished to stock the farm, so that new proprietor can enter at once into business, which should be started not later than August next. Our Harrisii Bulbs have a world wide reputation, and a good practical manager can secure handsome profits. Sold because other business claims my attention. Communicate with

R. H. JAMES, Preprietor, St. Georges, Bermuda.

REMOVAL NOTICE.

T. J. CORBREY. CHAS. W. McKELLAR.

CORBREY & McKELLAR,

Wholesale Commission Florists,

Telephone Main 4508. **64 & 66 Wabash Ave., CHICAGO.**

We beg to inform our customers that we have removed from the Chicago Cut Flower Exchange to Nos. 64 and 66 Wabash Ave., where we have secured quarters suitable to carry on a much more extensive commission business than heretofore, having the facilities to handle much more stock, and in a much more satisfactory manner, both to our growers and buyers. Our quarters being much enlarged, will enable us to add more consignors to our list. Growers of good stock wishing to place their goods in hands where it will be carefully dealt with, will make no mistake by giving us a trial. All stock received will have best of care and be disposed of to the best possible advantage. We settle all grower's account sales weekly, thus it necessitates our buyers to settle all accounts promptly. We issue statements semi-monthly, yet while we know parties to be punctual in making payments, should they prefer settling monthly, it is perfectly satisfactory to us that they should do so, but under no circumstances can we carry accounts over thirty days. Our aim is to do business on a cash basis, much as possible, thereby affording us the opportunity of giving our customers benefit of lowest possible prices, and enabling us in making prompt settlements with our growers. Parties unknown to us, when ordering flowers, will please send references or cash with order, otherwise goods will be shipped C. O. D. Buyers will make a saving by using our telegraph code whenever possible.

We make a specialty of regular orders, parties using certain quantities will find an advantage in placing regular orders daily, or as desired, as it will insure first-class stock at all times

All telegraph, mail and telephone orders given prompt attention. Should we be out of what you want, we will secure it if to be had in the vicinity of Chicago.

Increase Your Business

by fostering an interest in plants and flowers among the people in your vicinity. You can best do this by getting subscribers to

GARDENING . . .

which tells people how to get the most satisfaction out of their gardens, and stimulates them to enlarge and extend their gardening operations.

$1.00 A YEAR is the subscription price of this paper, which is issued twice a month, is handsomely and truthfully illustrated, is thoroughly practical, absolutely free from wind and gush and grinds no axes for anyone.

St. Louis.

The cut flower trade for the past week has been exceptionally good. The presentation of Grand Opera has had a marked effect on the market; prices have not advanced any but there has been a cleaning out every day that was gratifying to note. The stock most in demand was long Beauties with Meteors as second choice. The plant trade still continues slow despite favorable weather.

At the regular monthly club meeting which occurred on the 12th there was a very fair attendance. The exhibition committee having in charge the show, reported that it had decided to hold the coming exhibition in the art rooms of the Exposition Building in preference to the Grand Music Hall, which has been used heretofore. The difference in price between the cost of the hall last season, and the terms for which the art rooms have been secured for the coming show is $600, and it is expected that this will go a long way towards having a balance on the right side when affairs are wound up.

The responses secured from the various street car lines, regarding the placing of advertising on the cars, were very favorable and doubtless will be acted upon. The list of Shaw premiums as accepted by the board was read, it is about the same as far as plants are concerned, an important addition has been made however in the shape of four sets of premiums consisting of $20, $15 and $10 each, and offered for the best 25 blooms of white, yellow and pink chrysanthemums, one variety; also for best 25 flowers one variety, introduction of 1892, '3, '4. These being Shaw premiums are open to all competitors without the payment of any entrance fee or other charges. The prevailing opinion heretofore has been that our prizes have been too small to draw strong competition, but with the offering of the above and the decided increase that has been made in all the other classes, the competition should be as good as seen anywhere, and there should be displays from the best growers in the west.

The prize offered last year for a centerpiece, and which caused much discussion as to whether it should consist of one or more plants, bobbed up again, and it was finally decided not to limit it to one plant, but to confine to one variety.

A committee consisting of Mr. J. M. Jordan, John Young, and E. H. Michel was appointed to examine into and report upon the advisability of adopting some method of protecting those engaged in trade here from parties who systematically avoid paying debts. A short paper was read upon the use of manures and fertilizers in growing roses, which elicited quite a little discussion, after which the club adjourned.

The fourth series of games rolled by the Bowling Club closed last week, team No. 2 coming out first with 12,289 pins, No. 1 second with 12,231, and No. 3 third with 11,009. Mr. C. A. Kuehn wins the medal for high average, with a record of 201¾ for 12 games. This being the third time he has won the medal it becomes his personal property. Emil Schray takes the individual medal with a score of 266, and last but not least John Kunz retains a firm grip on the medal made from "hide" with a record of 120 5-12.

The coming series will not be as well attended as those during the winter owing to the rush of spring work, several notices having been received from members who will not enter. The same number of teams will be formed, but in all probability will consist of but five members each. R. F. T.

Address THE AMERICAN FLORIST CO., Chicago.

THE Milwaukee Florist Club has issued a preliminary premium list for its fourth annual flower show to be held next November. Copies may be had on application to the secretary, Mr. A. Klokner, Milwaukee, Wis.

WE HAVE RECEIVED cut blooms of Mme. Caroline Testout from Reinberg Bros. of Chicago, which were certainly remarkably fine. The stems were strong enough to support a Beauty, entirely without the weak neck so often seen, and the color and size of flowers excellent. A fine rose without question and likely to be of more commercial value as we understand it better.

MESSRS. F. Calvert & Son, Lake Forest, Ill., send us a Papa Gontier rose bud that is full three inches long, and in an accompanying note ask: "How is this for a Papa Gontier?" It is decidedly the largest bloom of Gontier we have ever seen, but the great size has apparently been at least partially attained by the "swelling" process and the color and texture have suffered in consequence.

THE Rhode Island Horticultural Society has issued the premium list for the June exhibition. Prizes are offered for strawberries in 24 classes, for roses in 11 classes, for cut flowers in 7 classes, and for plants in pots in 9 classes. Gratuities will be given for displays of early vegetables. Announcement is also made of a September exhibition of fruits and flowers and of the annual chrysanthemum show. Copies of the list may be had on application to the secretary, Mr. C. W. Smith, 61 Westminster St., Providence, R. I.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer, 114 Chambers street, New York. Next annual meeting second Tuesday in June, at Toronto, Ont.

DRY WEATHER is reported from the California seed growing districts, which, if not soon broken, may affect the coming harvest.

RAIN is also reported to be badly needed in the seed growing districts in France, no radish seed having been sown up to April 1.

J. A. SEVERNS, superintendent for D. M. Ferry & Co., with his family, has just returned from a three months' rest on the Pacific coast.

VISITING New York last week: Mr. Frank Emerson of Omaha, Neb., and Mr. W. Langbridge, Cambridge, N. Y.

THE SENATE has amended the paragraph of the Wilson bill referring to seeds so that Paragraph 611 of the free list now reads as follows: "Seeds of all kinds, bulbs and bulbous roots, not edible; all the foregoing not specially provided for in this act."

BALTIMORE, MD.—The Cleveland Seed Co., of New Jersey, has filed petition in Court of Common Pleas, praying that William B. Clark and Edward S. Frey, co-partners, trading as Clark, Frey & Co., No. 109 South Charles St., may be adjudicated insolvent debtors. The proceedings are based upon an alleged unpaid accepted draft for $365.77.

Slugs and Snails.

Mr. H. Grout, Springfield, Mass., writes that fostite is death to slugs and snails, and where this insecticide is freely used in the greenhouses snails are rarely found. His houses were full of them until he began to use fostite and this winter he has not seen one.

Charge for Storing Plants.

Will some reader of the FLORIST tell me what is the proper charge to make for keeping palms and other plants through the winter season. Also the same for summer season. A. B. C.

Indianapolis.

Easter trade here appeared to be about one-third less than last year. The retail prices were somewhat lower, and the supply was plentiful, excepting fine roses. Owing to the warm weather preceding Easter flowers were soft. The reasonable prices had a good effect all round. The home supply was larger than last year, but shipped stock was all sold at a profit. The favorite flowers were Beauties, red roses and carnations, and violets. There was no demand for bulbous stock. The demand for lilies was not as great as usual, but Beauties and violets were in great request, and good prices could have been obtained for them. Pot plants sold well as long as the weather kept warm. Decorations seem to be growing cheaper. If the weather had been pleasant the trade would have eclipsed that of last year. Cold blustery weather commenced Saturday morning, and by Sunday noon it was worse weather than we had at any time last winter. If the weather had kept up pleasant no doubt every flower would have been sold; as it was several of the florists had a big stock left, besides losing part of their reputation by frozen lily plants and other unpleasant things. Out door shrubs and roses have suffered greatly by the recent cold snap, which was very harmful on account of the warm weather we had before. We will all remember the Easter cold snap of 1894.

The monthly meeting of the Indianapolis Florists' Club was held Wednesday evening, April 4, while the attendance was somewhat slim a good deal of business was transacted. The usual annual state fair matter came up; this time solicitations are made on the part of the state fair officers; they agree to do all in their power to please the florists. A committee consisting of W. G. Bertermann, Anthony Wiegand, John Hartje and E. A. Parker was appointed to arrange all details with the proper superintendent of floriculture. A conference will be held probably next week.

A letter was presented from Mr. Chislett, Supt. Crown Hill Cemetery, stating that the rules had not been changed (it being reported that no plants would be allowed to be planted by lot owners), but some system would be adopted that would prevent promiscuous planting of shrubbery, etc., by lot owners. Probably a general supervision would be instituted, and very likely large bedding would be adopted by the cemetery company.

Mr. Langstaff wanted meetings discontinued for the summer, but the motion was not sustained. It was decided instead to make the May meeting one of social character.

Henry Rieman read a well prepared paper on the preservation of cut flowers and blooming plants for the holidays when the season is forward, of which we have had experience this year.

Albin Schreiber, foreman for Bertermann Bros., was thanked for a beautiful selection of carnation and calceolaria blooms.

The committee for the Carnation Society Convention reported all bills paid and a small balance left. All those who helped to make this meeting a success were heartily thanked.

Secretary Bertermann of the state society reported that advance premium lists for the eighth annual chrysanthemum show are printed, and can be had by addressing him at 37 Massachusetts Ave., Indianapolis. W. G. B.

The Wilson Bill.

Paragraph 666 of the tariff bill of 1890 placed "Orchids, lily of the valley, azaleas, palms, and other plants used for forcing under glass for cut flowers or decorative purposes," on the free list. The Wilson bill as reported to the House recommended the retention of this paragraph (under number 572) in the new tariff, but the Senate has now amending by omitting this paragraph from the free list and substituting elsewhere paragraph 234½ as follows: "Orchids, lily of the valley, azaleas, palms, and other plants, used for forcing under glass for cut flowers or decorative purposes, ten per centum ad valorem."

Nursery stock, upon which there was a duty of 20% ad valorem in the tariff of 1890 is placed upon the free list by the Wilson bill in paragraph 587 which reads as follows: "Plants, trees, shrubs, and vines of all kinds commonly known as nursery stock, not specially provided for in this act," and this has been concurred in by the Senate.

Garden seeds, upon which there was a duty of 20% ad valorem under the old tariff are placed on the free list by the House bill. The Senate leaves them on the free list but makes the paragraph broader by omitting the list of varieties and inserting the words "of all kinds," so as amended paragraph 611 reads: "Seeds of all kinds, bulbs and bulbous roots, not edible; all the foregoing not specially provided for in this act."

As will be noted bulbs and bulbous roots are covered in the above paragraph and are therefore retained on the free list.

Capacity of Boiler.

What is the capacity in feet of 4-inch pipe of a horizontal tubular boiler 6½ feet long, 3 feet in diameter, and containing 24 3-inch tubes? G. F. M.

A horizontal tubular boiler 6½ feet long by 3 feet in diameter, containing twenty-four 3-inch tubes, has a heating surface of 165 ft. and is of eleven horse power. The grate surface should be 3 ft. by 3 ft. For steam heating this boiler should take care of 1100 ft. of heating surface, or if for hot water heating, without pressure, about 2200 ft. of heating surface; as one foot of 4-inch pipe is equivalent to a foot of heating surface, the boiler will take care of as many feet of pipe as feet of heating surface given above. LINCOLN PIERSON, Of Lord & Burnham Co.

COLEUS.

In Assorted lots only.

ROOTED CUTTINGS, in 30 to 40 varieties, (our selection), at $6.50 per 1000 by express; in 20 varieties, at $1.00 per 100 by mail.

NEW KINDS, including some of the most handsome ever offered for sale, in 10 varieties, at $2.00 per 100 by mail.

We will include at least 50 cuttings of the new kinds in every 1000 purchase.

The St. Louis Florists' Bowling Club.

I'll sing a little song,
The singing won't take long:
To the east this summer we will go
And win that cup, we will by Joe.

We are led by Charlie Kuehn,
The captain of team one,
The banner bowler of the club,
He always takes the bun.

And then there's Dr. Helwig,
Who made 87 in one game,
And now for an excuse he says,
That he was very lame.

All hail to the kid of the club,
Capt. Ellison from the hub,
When uncle Harry starts to roll,
He'll try to show him how to bowl.

And then comes Johnnie Kunz,
He of leather medal fame,
We all know he's a dead game sport,
But he gets there just the same.

When Tom Peterson makes a poodle,
They all say he's off his noodle,
But after a strike he swims for his seat,
And says those ducks I have to beat.

You all know Rob and Charlie Beyer,
Whom all the boys admire,
No better bowlers are in the club,
They are always ready to give one a rub.

And Harry Young, our lucky man,
Who gets down to the h'alley;
He tries to do the best he can,
For Mary Ann and Sally.

Look out for Sandow Ostertag,
To much he don't amount,
But when he's got his Daisy there,
You bet he makes them count.

And there's our good friend Schray,
A bowler hard to beat;
His mustache is like the maiden hair,
But he'd sooner bowl than eat.

There's Charley Young and brother Bill,
Who come from yonder on the hill;
They are bowlers on the fly,
Why Bill made 277 and didn't half try.

You all know Bobby Tesson,
One of the dandies of our crew,
They all say he's so handsome,
With his two little girls in blue.

And then our old friend Waldbart,
Who has so long been sick;
We all hope to see him back again,
To make his usual kick.

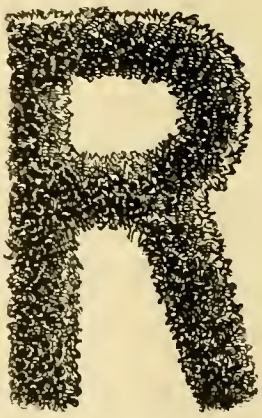
Then there is handsome Sanders,
Whom every body likes,
For strikes and spares he always gets,
While his brother sells the bikes.

The Brothers Ostertag, Henry and Fred,
Always too busy to bowl,
But come down just once in a while,
To help their team out of a hole.

Our Treasurer, too, with cane in hand,
John Young of course is one of our band;
He handles all the cash we've got,
And he likes to bowl when cold or hot.

With Roper and Sexton from the nest,
They try to see who is the best;
One on team one, the other on three,
You'll always find them busy as can be.

Then Lawson and Frank Fillmore,
Two new members that is true,
They make some poodles and a few pins,
But strikes and spares are few.



The man who wrote this little song,
Is a member of the club it's true,
He won just one medal,
Hard luck kept him from two. J. J. B.

FLORIST!

Aren't you tired going through your houses two or three times a day year after year and lifting your ventilating sash one at a time and propping them up with sticks or pots, with a chance of having sash blown off and broken glass to pay for? If you are

We have got just the thing you need, the **NEWEST** and **BEST** thing out. "The New Departure" for **about half** the cost of the old style. Send for Descriptive Catalogue to

J. D. CARMODY, Evansville, Ind.

TO TAKE PLACE OF WIND MILLS

HOT AIR PUMPING ENGINES

A Windmill

Is unreliable because it depends upon the elements for its power; hydraulic rams also depend upon favorable conditions and waste as much water as they secure. Steam pumps require skill and hand pumps demand labor and time. The

DE LAMATER-RIDER OR DE LAMATER-ERICSSON Hot-Air Pumping Engines

are especially designed for pumping water, and from shallow streams or any kind of well. They are simple, safe and reliable, require no steam and have no valves. They require very little heat to operate them, and can be arranged for any kind of fuel.

Send for illustrated catalogue to

NEPONSET • FLOWER • POTS

of Waterproof Paper, light, durable, unbreakable and cheap.

Tomato Growers have used them with success and proved their appreciation by repeated orders.

Cabbage Growers have tried them and duplicated their orders.

Market Growers of Verbenas, Alyssum, Coleus and other plants, which do not shun moisture, have used them extensively in repeated seasons.

Recommended for light and safe packing of tender and valuable plants, for the marketing of Ferns, Dutch Bulbs, Lily of the valley and the like.

Cost about 40 per cent less than earthen pots, and weight considerably lighter, thus saving in first cost and freight.

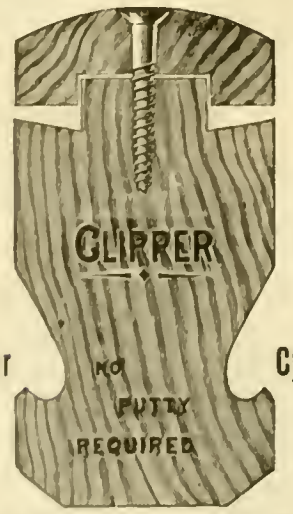
Toronto.



The cold storm wave which swept over the continent a few days ago seems to have been pretty general and did not forget to give this city a call. So far I have heard of no damage having been done, and since it passed the weather has been fine and mild; of the five inches of snow which fell only an isolated patch here and there in sheltered spots remained the day after as a remainder of what J. Pluvius Probs can do when he gets on a bender.

The cut flower trade is getting demoralized now and it is too late in the season to expect any improvement in that line. Some left over Easter lilies and other plants are being offered very low just now, but the general plant trade is brightening up a bit and will improve from this on.

I notice in Mr. W. J. Stewart's paper on "Ornamental Horticulture at the World's Fair" he deprecates the one judge system as un-American in principle. I should very much like to hear him explain how this can be. In our G. and F. Association the one judge is chosen by a majority of the members and I presume other associations, clubs and societies do likewise. Is not the President of the United States elected by a majority of the people as their chief officer? We here have found the one judge system work well and give more satisfaction than the three judge system. E.

CONCORD, N. H.—The florists of Concord have reason to feel well pleased with the results of Easter trade. The heaviest demand was for well grown specimens of lilies in pots; spireas also went well. There was considerable decorating done with palms, dracænas, etc. Large quantities of lilies were sold as cut flowers. The demand for carnations was excellent; although a fine crop awaited sale at the various local establishments, the Boston market had to help supply the demand. Tulips and violets went rather slow but finally everything in the shape of a flower was sold.

Announcement to Florists.

We desire to announce the dissolution of the firm of Sipfle Dopffel & Co., and to introduce to the trade its successor, The Syracuse Pottery Co., which will be under the management of William Dopffel and Conrad Breitschwerth. The business will be conducted as heretofore, except on a larger scale to meet the growing demand for our goods. We have accordingly enlarged our plant and capacity, and with unsurpassed facilities are now prepared to fill the largest order on short notice. Our latest improved machines are turning out the best and most serviceable flower pots in the market, and assuring you of our intention to lead in further improvements we solicit a continuance of your patronage in the belief that we can supply just what is needed at a price and in a manner satisfactory to all.

Send for price list and samples and we know you will give us an order.

Hail Storms.

A hail storm struck the greenhouses of Chapin Bros. at Lincoln, Neb., last week. They were partially insured in the Florists' Hail Association. Secretary Esler reports numerous applications for insurance as a result of the storm.

A press dispatch from Clayton, N. Y., under date of April 20 says: "A fierce hail storm set in here at 7:15 o'clock tonight. Hailstones measuring from 5 to 8 inches in circumference covered the ground. This is a phenomenon never before experienced in this part of the country. Much damage was done."

DO YOU WANT the census statistics regarding the florist, nursery and seed trades? You will find them in our trade directory and reference book for 1894. Price $2.00.

Arrangement of Flowers.

SIMPLE BASKETS.

The arrangement of baskets is a subject that covers a wider range than that of any other division. Notwithstanding the fact that the demand for made-up baskets is not nearly as large as was the case in former years, still we receive constant orders for them, though not in as large numbers as could be desired from a financial standpoint, for in basket arrangement we can often use material to very good advantage which, on account of insufficient length of stem, can not be sold to good advantage as loose cut flowers. The main objection to the basket from the buyer's point of view is that the flowers wilt too quickly, often lasting but a few hours. The objection is well founded as regards the great majority of such arrangements, but the fault lies very often in the careless way in which the flowers are put in. If properly put up the flowers in a basket, if fresh, will last in good condition a reasonably long time, although of course not as well as when the stems are placed in water.

We find it to our profit to encourage the demand for this class of arrangements as much as possible, and to our mind the waning popularity of the basket can be resuscitated by giving a high standard of excellence in the manner of arrangement, and above all by giving careful attention to keeping the flowers from wilting as long as possible.

Almost all of the stock used for this class of work is stemmed on either picks or match sticks, but the fact that the pick only serves the purpose of enabling us to guide the flower stem into the moss is too often lost sight of and the pick or stick is regarded by the maker up as part of the stem and so long as the flower will hold in position very little attention is paid to whether the flower stem is firmly imbedded in the moss or not. It is no wonder that flowers, whose stems very often do not even reach the top of the moss, wilt so soon. This you will say is gross carelessness. True, even a novice in the business ought to know that flowers cannot keep under those conditions, and yet we find this practice indulged in by old and experienced hands. Not but what they know better; in fact we find it most apparent in the highest class of work; the keeping quality is too often lost sight of entirely for the sake of an artistic appearance; thus if a certain kind of flower is stemmed too short in order to give the desired effect, it is raised high and dry above the moss, and if the stick be too short another length is added; a few green leaves will hide the stick, which may carry the end of the flower stem 3 inches above the moss. Such a basket may meet the artistic ideas of the designer, and on first appearance be entirely satisfactory to the purchaser, but what about its usefulness? Tasteful arrangement should certainly be aimed at every time, without it we cannot progress, but it should not be placed above all other considerations if we ever expect the basket to regain its oldtime supremacy.

There is no form of arrangement that admits of greater diversity in style and form than does that of the basket, with hundreds of different shapes and forms, each one of which can be built up in an entirely different manner. It offers a splendid field to the ingenious maker-up.

The meaning of the term "basket" is rather vague as applied to the forms used in our business. The proper definition of what constitutes a basket has been a matter of debate from time to time but it is not our intention to go into this subject any further than is necessary. Let us call those forms baskets that are made of willow, celluloid, rattan or wire, either with or without handles, whether oval, round or square. Such forms as are used for table decoration form a different group, and will be considered when we reach that class. We will give our first attention to the simpler forms.

Our first illustration shows a high handle basket of a size such as can be put up at this season of the year for about $5, of such quality of mixed material as was used.

We have already shown how to moss up baskets in general, but as has been stated before, the style of basket must always be taken into consideration as regards the heights to which the moss should be raised. In the form under consideration it is well to have the moss rounded up fairly high. In the first place it will aid us in making a better display of the material, and besides we can also use short stemmed flowers to better advantage, and there will be no need to raise them up on stilts.

Now let us select the material. In the first place we want green around the edge of the basket. In this case we used wood ferns for the purpose, but if smilax is at hand this can be used also to good advantage. The short pieces found at the bottom of the plants after the strings have been cut out serves our purpose just as well. If the strings are used, cut in lengths according to the height of the basket, say 6 inches, and stem on tooth picks. If fern leaves are used stem also on picks; if too long break off a piece, stemming the two sections together, the piece containing the tip of leaf on top. Now arrange the green around the edge of the basket in such a manner that the vines or leaves will droop over the rim; cover the sphagnum in the center of the basket with green of such description as may be at hand, small bits of broken fern leaves, smilax and the like.

We prefer to drape the handle of the basket before the other flowers are arranged, but this is optional and can be

done after the basket is filled as well. Either smilax or a spray of Asparagus plumosus may be used. Select the top end of a piece, say of smilax, of sufficient length to reach over the handle, and fasten to the same by means of wire. Next run a spray of flowers up one side of the handle. Our illustration shows this to be formed of a combination of red roses and marguerites; as the top flowers on this spray cannot reach the moss we may wind in around the stems of the flowers some green sheet moss, which if wrapped tight and thoroughly wet will preserve the flowers; the stems of the flowers forming the lower part of the spray should be imbedded in the sphagnum.

For the body of the basket we use a variety of flowers, none of which will be required of very great length of stem, yet a number of them should be at least 6 inches long. If sufficiently stiff in stem no supporting wire should be used, but if weak treat them in the manner illustrated in our article on stemming. For a basket of this form we prefer the use of match-sticks, cut in lengths of about 5 inches, to that of picks, particularly as regards roses; cut them to a sharp point so as to be enabled to run the stems of the flowers well down into the moss. Roman hyacinths, daisies, adiantum and all the lighter forms can be stemmed on picks. The flowers used in this basket consisted of the following: Short stemmed Jacque roses, La France, Perles, Brides, Roman hyacinths, marguerites, and a few bright pansies. Commence the arrangement by starting at the center of the basket, selecting the longest stemmed flowers for this position, and continue down to the edge, drooping the last row of the flowers well over the rim. Don't set the flowers all at the same heights; the smaller buds of the roses should be raised above the level of the heavier forms. Be careful to preserve the character of the spray on your handle by running the same class of material pretty well down on that side of the basket. For foliage between the flowers adiantum serves our purpose admirably and greatly adds to the effect, but this fern wilts very quickly and great care should be taken to run the stems into the moss; but even then in a warm room it will not last any length of time. A. plumosus or A. tenuissimus, if at hand, answers equally well and will last much longer. In addition to the above mentioned varieties many other sorts can be used, such as small L. Harrisii, candidum, carnations of various colors, valley, violets, mignonette and many varieties of annuals in their season; only let us be careful when using a mixture not to place flowers of opposing shades of color in close proximity; this can be avoided by placing the neutral shades of white between.

Let us next consider a shape without a handle. Our second illustration shows a 12-inch oval flat arranged in an entirely different manner. Here the varieties are not mixed together, but each kind kept separate and the whole grouped together to form a harmonious combination. Such combinations can be made in almost endless variety; no two need be made exactly alike. The basket we illustrate is composed of Wootton, Perle and La France roses, marguerites, pansies, forget-me-not, and mignonette.

For green the same material may be used as was mentioned before, and arranged in the same manner, but as the design is lower the smilax and other green will not have to be quite so long.

In order to give a loose effect the flowers should be stemmed of a length not less than 5 inches, but have some larger than others. The first illustration of this basket shows the arrangement of the green and the section of Perles in the left hand side of the basket, with a few of the Woottons placed in the center. These Woottons are carried diagonally across the back of the basket to the right hand end of the piece, which is hidden from view. However, in the completed form, as shown in No. 3, the vacant place seen in No. 2, in the group of Perles, is filled in with a small clump of forget-me-not. Next is arranged a spray of marguerites separating the red from the pink roses. The remaining space in the front is filled in with La France. The last section of the basket, which however doesn't show in our picture, is made of pansies, a spray of mignonette forming the dividing lines between the pansies and Woottons. Adiantum is used freely to give the whole a graceful appearance. The lines of the sprays of marguerites and mignonette should not be drawn too sharply, but should intermingle with the flowers composing the sections through which they pass.

Smaller and less pretentious baskets than the ones illustrated are made, but for a new beginner these are generally more difficult to start in with than the larger ones. These and the more elaborate forms will form the subject of a future article.

Phaius.

Phaius are a genus of terrestrial orchids which flower principally in March and April and are thus valuable on that account. The old Phaius grandifolius being one of the earliest tropical orchids introduced to cultivation, is too well known to need description, but those who have not grown P. Wallichii, I would recommend to do so, it being so much more showy than grandifolius; also tuberculosus, which was introduced about twelve years ago and no doubt is the most beautiful of the genus. Humblotii, which was introduced about the same time, is very fine though not so beautiful as tuberculosus, moreover this species flowers in the summer months.

Then we have again the recent introduction of Phaius Sanderiana, which is a robust grower and a very decorative plant, carrying a flower spike five feet in height and individual flowers measuring six inches across, of a rich tawny brown color, margined white, yellow behind, lighter veins; lip large and well open, white, with rich brown throat, shaded with pink; a truly majestic and showy plant carrying on its massive spike about eighteen to twenty flowers and lasting long in perfection. This plant is of easy culture, growing in an ordinary cattleya house and requiring plenty of water during its growing period; in fact it is a gross feeder.

But the most interest is now centered on the new hybrid phaius which have recently been introduced. The Phaius Cooksoni, which is a hybrid between Phaius Wallichii X Phaius tuberculosus, and which we have now in flower, is indeed a very pleasing and interesting plant. The leaves are intermediate between parents, scapes shorter—ours eight flowered, flowers almost as large as P. Wallichii, sepals and petals light rose with yellowish brown along their middle, the left funnel shaped, broad, with a very crisped margin, basal half yellow, the rest of lip rose, spotted with carmine purple.

Phaius amabilis is another hybrid between Phaius grandifolius X Phaius tuberculosus and was raised by Mr. Seden two years ago. It is a very striking plant and a fit companion for P. Cooksoni. This is intermediate in form between parents, of good constitution having the vigor of grandifolius, and throwing up a sturdy spike about eighteen inches high with twelve large flowers over three inches across; the sepals and petals rose colored, the lip broad, well open and suffused over whole with rich carmine purple.

These plants should be repotted at this season immediately following their flowering, in a compost of fibrous loam and peat with sphagnum. Give plenty of drainage and pot firm. Liberal waterings should be given when in active growth and when pseudo-bulbs are developing liquid manure can be used. Keep to the light but from direct sunshine.

W. ROBINSON.

Orchids in Mr. Hicks Arnold's Conservatory, New York.

When the visitor observes the many genera amassed together under one structure, as we find them here, thriving luxuriantly, and rewarding the grower with ample bloom at all seasons, demonstrating the enthusiasm of their owner and the watchful care of his cultivator, Mr. Morris, he cannot resist expressing much admiration and praise for the diligent observations as to the varied requirements of so many valuable treasures.

Owing to the limited space available for their reception, only the most select forms have from time to time been added. Cattleyas, lælias, dendrobiums cypripediums in quantity, ærides, vandas, saccolabiums, sobralias, phajus, lycastes and odontoglossums, some of the warmer kinds, are placed from stage to roof in all positions so that the house resembles a veritable forest, the walls at each end being tastefully covered with selaginella, begonias, ferns in variety, Ficus repens, Panax Victoriæ—in fact everything to aid moisture, and provided with every essential for the wellbeing of the plants. The air at all times is charged with humidity produced by syringing this combination of plant life daily.

The cypripediums are well grown, and embrace a number of extreme rarity. Among them now in bloom is a beautiful example of C. Paris, a supposed hybrid between C. bellatulum and C. Stonei. It is a remarkable hybrid of great interest; the ground coloring of the sepal and petals is light cream, with a suffusion of pea green; at the base of the segments on either side of the broad dorsal sepal, also the apical portion, a light flush of purple is seen; the whole flower excepting the pouch is marked with numerous spots and lines of dark maroon purple, the pouch being light purple and suffused with pale rose. Although a decided acquisition it is unfortunately very rare.

Another interesting hybrid in bloom is C. Graynnum unicolor, carrying two flowers. In coloring it deviates from the existing forms, being much lighter. Its parents are C. Druryii and C. ciliolare, the coloring of the former predominating very much in the variety here noted.

ROUND HANDLE BASKET.
ARRANGEMENT OF FLOWERS.

Many of the best varieties of C. Curtisii may be seen in this collection; the variety named platypetalum is remarkable for size of pouch and breadth of petal. C. Germinyanum, C. Louryanum, and C. Chamberlainianum are in bloom, the latter in several pretty varieties, also a fine lot of C. callosum, some of the flowers being immense. C. Sanderianum grows here with surprising vigor, and blooms annually from comparatively small plants.

Among the cattleyas are many gems of great value. A most exquisite form of Cattleya Trianæ alba carries four blossoms perfect in shape and of fine substance, with a broad labellum handsomely frilled. In dark varieties C. Trianæ Smithiæ is one of the finest, having broad sepals and round undulated petals very rich in color, and a superb labellum bordered with a very thick frill.

C. Lawrenceana does well here; its glowing purple blossoms are very effective, the plants are grown in baskets, suspended in a position where they receive light and air in abundance during their growing season, and a copious supply of water. This is a good orchid, but is every day becoming a more valuable plant; importations of it are not numerous, its native country only being reached by suffering severe hardships and danger to health. Cattleya Mendelii is now pushing forth its flowers, and here is found the rare and remarkable Quorn House variety, a superb white form with enormous flowers of a very chaste character. Lælio-Cattleya Arnoldiana, one of the finest hybrids ever raised, is represented here by two healthy specimens, and will shortly be in bloom, C. Aclandiæ is in flower, growing freely on rafts, Epidendrum prismatorocarpum has several spikes, and there are many other equally showy things.

The collection of Lælia anceps is a very choice one, L. a. Ballantineana, L. a. stella, L. a. Schroderiana, the finest of all the white forms, L. a. Sanderiana, L. a. Dawsonii, L. a. Hillii, L. a. alba, the snow white form with a pea green throat, all were flowering this past season in profusion.

To ensure such excellent results every facility is utilized to surround the plants with air, moisture, and light in abundance, especially while in active growth, a watchful eye being kept for all such enemies as slugs, thrips, and scale. No hard and fast rules can be adopted for the well-being of the plants, where one or two houses are only available. Many varieties may be grown with satisfactory results, providing a careful observation is given to the plant's requirements. If they do not succeed in one position give them a trial in various quarters of the houses until success is assured by finally securing a place the plant will enjoy.

A. DIMMOCK.

Ferns and their Culture.

BY E. ASMUS, JR.

[*Read before the New Jersey Social Florists' Club, April 5.*]

Ferns are at the present time in such great demand that I have chosen them for my subject. Few plants are put to so many uses, both for indoor and outdoor decoration. I should say that there are few plants that give more pleasure through the entire season than a collection of ferns. They are flowerless plants, and belong to the natural order of Filices. There are few orders of plants which have such a wide distribution, being found in the tropics, in the temperate zones, on high mountain ranges, and as far north as Labrador and Greenland. Some varieties grow in the dense shade, such as Todea superba and trichomanes; some in partially shaded places on the margins of woods, on the hillsides and along stone walls, like most of our native ferns, such as osmundas and aspleniums. A few varieties, such as nothochlæna and cheilanthes, grow in the driest sun. Some varieties are very small, while others again are very large, the Dicksonia antarctica reaching a height of twenty to thirty feet in its native habitat. Some varieties have creeping rhizomes, and grow upon rocks and trees, while others throw out their fronds from crowns, like Lomaria gibba and other varieties of the tree fern family. Still, under these varied conditions, they are a very easily cultivated class of plants if their requirements are carefully looked after. The best lesson can be obtained by observing some of our native ferns in their natural haunts.

Beginning with the fern from the spore state is a very interesting study. The first thing to be done is to procure good, fresh spores, these being the reproductive organs. They should be carefully saved and each variety tied up in a separate bag, so that there will be no danger of their becoming mixed, for they are so small, and even finer than the proverbial mustard seed. When they are good and dry they readily loosen themselves from the back of the frond to which they are attached. After the seed is properly cleaned the next thing to be done is to secure the proper material on which to sow them. The best material I have found is a mixture of leaf mold and fine peat run through a fine screen to take out all fine roots and small sticks to facilitate pricking them off at a later date. After soil has been prepared, secure some good clean pots. (Be sure they are well washed, new pots being in all cases best.) Fill these with some good drainage to about an inch from the top. I have found coal ashes the best material for this purpose. Then place soil on top, firm well, and give a thorough watering before sowing the spores. After they are sown the pots should be placed in a close frame until the ferns are up, but during that time they should never be watered overhead. If they should become dry put pots in some vessel containing water and let the water soak up from the bottom of the pot. When the spores are in the prothallus state, which is the most critical time, great care must be taken against damping.

When large enough, which can only be learned by close observation, they should be pricked off in flats filled with the same mixture on which they were sown, in small blocks about a quarter of an inch square and placed about an inch apart each way. These flats should then be placed in a warm frame or near the glass in a warm, close house, covered with

glass, and closely watched, going over them every morning to look out for fungus, which is so apt to appear when they are in this state. The best thing to do is to pick the affected part out and cover the place with a little slacked lime, so that the fungus will not go any further, as, if care is not taken in this respect it will spread over the entire flat in a few days. Great care must also be taken in watering, never allowing the soil to become sodden. When the plants have reached the state that one or two small leaves can be seen, the glass can be removed and flats placed in a somewhat cooler house on a bench near the glass, shaded from the direct rays of the sun. When the plants are large enough for 2-inch pots, which will be about six months from the time of sowing, they should be potted in a mixture of good loam with an addition of well rotted leaf mold or horse manure. I think the latter preferable, owing to the strong feeding qualities of most ferns, especially adiantums. There should also be added a little sand to keep the soil open. After they are potted the house should be kept quite close for a while, until they have received a start, when the temperature can be gradually reduced.

In watering great care is very essential. Although they are great moisture loving plants, they should never receive so much that the soil becomes sodden; neither should they be allowed to become dry, for if fern fronds once become wilted they will never revive. Never water overhead, especially such varieties as Adiantum Farleyense, the gymnogramme family, and many others, or their beauty will be marred.

Ventilation should always be looked after carefully, giving a little on all bright and warm days, but never giving too much to cause any cold draughts, with Adiantum Farleyense in particular.

Shading is another very important factor in their successful culture. Although they are, as a rule, with very few exceptions, a shade loving plant, it should never be attempted to grow them under the benches or some dark out-of-the-way-corner. The best results are almost in all cases obtained when they are grown in a good light house, near the glass, with enough shading to keep the hot rays of the sun from scorching them.

Carnation Notes.

The most formidable enemy the carnation has at this season of the year is the red spider; rust and other diseases are injurious but the spider, if it gets a start, is positively ruinous. He can destroy more in a week than rust will all season and is a hundred times as hard to fight. If the carnation was an aquatic plant that we could use water on it without limit (that is the best remedy) we would be all right, but it is not and an attempt to clean up a bad case of spider is likely to be very injurious to the plants, as the spider is very hard to get at completely on a carnation plant.

There are remedies galore for the spider and all are good or fairly good when you hit the spider, but the trouble is to hit him. I have tried them all, my last experiment being with salt water, but I have yet to find a satisfactory cure. A grower who recently visited my place and saw the experiments suggested that alum water be put on hot; he had heard some one say it was good. So that will be my next experiment. I would like to know if anyone has a good and practical remedy for the spider and there are lots of other growers would like to know the same thing.

You will likely want to run your carnations until Decoration Day at least and more than likely for the commencements, so whenever you have a little time to spare use it in keeping them in good shape tied up nicely and weeded; the flowers will be enough better to pay well for the time. Disbudding will keep your plants in better growing shape and pay for itself in the increased value of the flower. Golden Triumph is not a popular flower but I am producing blooms of it by disbudding that will put to shame any other yellow in the market. I am not saying this to recommend this variety, for taking the season from beginning to end it will not have paid me to grow it, but as an object lesson in disbudding it is a decided success. It is well to shade the houses with a mixture of naptha and white lead and thus save considerable time in watering and also keep the color of the flowers better. If your houses are not shaded, such varieties as Portia and all bright colors will lose their color a day after they are opened.

The young plants should be planted out now as fast as you can. If they have been potted and are pot bound it is well, as they are knocked out of the pots, to take a knife and cut the roots on each of two sides of the pots so as to induce them to break new fibres quickly. Cuttings can be planted direct from the sand bed with a little extra care and preparation of the soil, and of course such plants should be put out only in good growing weather. It is not advisable to plant rooted cuttings out direct that have been shipped to you; it will pay well to plant them in trays and take good care of them until they have made a nice lot of those little fibrous white roots; they can then be planted out with success.

A. M. HERR.

12-INCH OVAL FLAT PARTLY FILLED.

ARRANGEMENT OF FLOWERS.

The Shrubs of Toronto's Lawns.

BY D. W. BEADLE.

[*Read before the Toronto Gardeners' and Florists' Association at the April meeting.*]

Visitors to our city have frequently remarked that its citizens seem to have a singular fondness for pollarded shrubs, and express surprise that a style so unnatural and inartistic should have become so prevalent. Are the gardeners, it is asked, so ignorant of the rudiments of their calling that they know nothing better than to shear off the tops? Were they to set an array of old time birch brooms, brush end up, they would be scarcely less becoming.

In the early days of ornamental gardening all kinds of fanciful forms were given to trees, hedges and shrubs. This style of pruning had some claim to being a work of art, and an exhibition of the gardener's skill. It can not be said that this pollarding exhibits skill, or is in any sense a work of art, for any horse or cow in browsing them could do as much.

Shrubs are supposed to be planted as an adornment of the grounds. Each species has its individual style of growth, wherein lies its own expression of beauty. It is this individuality, especially when the time of inflorescence is past, that gives variety and attractiveness to the lawn. The eye of the true gardener perceives the charm of the natural form of each, and prunes so as to preserve and develop the distinguishing feature of the several varities. Herein is manifested his appreciation of the varied beauty of nature, and his skill in giving it full expression. But the cropping system wholly destroys this naturalness. It gives to all an unvarying uniformity, and to the eye of every lover of nature a very distressing unsightliness. Beside, much of the bloom is shorn away, so that when in flower much of their brightness and beauty is lost, and thus the very object for which they are planted is defeated.

Not every man who can run a hand-

12-INCH OVAL FLAT FILLED.

ARRANGEMENT OF FLOWERS.

mower has the eye and the hand of the experienced gardener, nor can it be expected that skilled labor can be purchased at the cost of mere muscular force. If this style of trimming is the outcome of a matter of economy, we suggest that it would be not only more economical, but also much more ornamental to leave the lawn without shrubs. Such misshapen caricatures of nature are no ornament. The beauty of many of Toronto's lawns, and the attractiveness of the city to its visitors, would be greatly enhanced if these pollarded shrubs were all dug up and consigned to the brush-heap.

Among Chicago Growers.

LAKE FOREST.

The first section of the McCormick rose houses at Lake Forest was built years ago and consisted of 2 houses 30x150. These were built in what at that time was considered the most approved style for rose growing. This style of construction as well as the manner of growing roses on benches in 3 inches of soil, was quite an innovation at the time. As little or nothing was known in the west of the merits of this mode of growing, our local talent looked on in a rather skeptical way predicting all manner of failures, but the result soon proved it a complete success. But this establishment was not alone the pioneer in the growing of roses in a radically different manner from that practiced before; it also introduced in our market what were at that time called fancy roses. The varieties grown were Mermets, Perles, Niphetos and Cook. The Cooks, by the way, were grown in pots and such flowers as were produced here the first season were never seen since, either at this, or any other establishment around Chicago. Cook has disappeared from our markets entirely since the advent of the Bride, Niphetos is going fast, and Mermet has probably seen her best days. Perle is about the only one of the old sorts that has as yet no formidable rival to dispute honors. While the Mermet has seen her best days the sterling good qualities of this popular sort are as unimpaired as ever, but her rival, the Bridesmaid, is such a decided improvement as regards color that the older variety will in all probability be relegated to the rear to a certain extent. But although Mermet will cease to be a dominant factor as a pink variety in our market, we doubt if it will ever be crowded out entirely.

Many growers, particularly those who were caught in the Waban craze a few years ago, are rather cautious about investing in any new pink variety. "Mermet is good enough for me; let some other fool experiment with new varieties; I have been bit often enough," are expressions we meet with quite frequently. Yet the good qualities of the Bridesmaid are no longer a matter of speculation. Any grower so disposed can investigate for himself by seeing it grow at various establishments around the city.

Mr. Kennedy, an experienced grower, who manages the affairs of this establishment, in speaking of this variety says: "My experience with this rose the present season, is such that I feel warranted in recommending it very highly. With me it has proved the best paying variety we grow. I bought last spring 1,000 plants from the house that introduced this sort. Being personally acquainted with Mr. Moore I relied upon his judgment as to the merit of this rose, but I must admit that I didn't feel quite easy in my mind. The thought of the Waban was still a nightmare to me, but all I can say now is, that I wish I had bought 3,000 instead of 1,000. You will notice that these roses are planted in various situations in different houses. Here is one lot on a front bench, another on a center bench, and still another is grown on the rear bench of a house. I did this to test the variety thoroughly. There is little if any difference in any of them. The habit of this rose is certainly as good as that of Mermet, with me it seems even a stronger grower, and as regards yield fully as good. I intend to bench at least 3,000 plants this spring."

One house we find already planted with young stock, which was benched about March 1; the balance will be planted later.

Mermets and Brides are just coming in with a fine crop. Most of these are young stock, but we find several tables of 2-year old plants looking exceptionally good. These Mr. K. informs us have yielded a larger crop than the young plants but the buds average a trifle smaller. Gontier and Perle also look well. Of the latter there is one, the lower one of the tier of center tables, the soil of which is covered with a black water lichen which makes its appearance in the same spot every year but has never spread beyond the limits of this bed and is found growing on the soil underneath the bench in great profusion. The appearance of this bench would indicate that the soil is waterlogged and sour, but such is not the case. The lichen, which forms a thin black and shiny crust on top, leaves the soil underneath in good condition and apparently does little injury to the roses, which look quite healthy and thrifty. The soil on the bed is of course removed every year and the house underneath has been regularly cleaned out. The house, like all the rest, is high and airy and the walks of cement, but yet the lichen sticks.

Beauties have done but little this year. Meteor also doesn't look very well. "I have tried Meteor in various ways," says Mr. Kennedy, "but with me it is very unsatisfactory in winter. This year we grow it in a house where an abundance of heat can be supplied at all times, but the result is as disappointing as ever. During fall and up to the end of December it behaves well enough, but during winter most of the blooms are badly crippled and off color."

A change has recently been made in the heating apparatus to overhead flow, and return pipes underneath. This system is much more satisfactory than the former mode of heating underneath. "I found," says Mr. K., "that at certain seasons of the winter the young growth of the plants, more particularly on the highest benches nearest the top of the houses, got badly affected from what I determined to be an overabundance of moisture at the top. The young shoots would often drop their leaves, and sometimes damp off entirely. Since the flow pipe has been placed overhead this trouble has disappeared."

At Mr. Parcell's place we note a sport of the Bride which appears to have merit. The flower is striped and veined with pink the shade of Bridesmaid, and is quite pleasing in appearance. The sport appeared last winter. Four plants were propagated from the shoot, three of which are seen in bloom now. All the blooms show the variegation in the flower quite true to the original. There seems to be little doubt of the color being "fixed," but how far it may prove of value as a commercial flower we are not prepared to say. Mr. Parcell proposes to grow it another season on a more extensive scale, and we may then be enabled to judge of its merits more correctly.

Hild Bros. place is looking well. Their La France are just coming in with a fine crop and are the best around this section of country. The balance of the stock grown consists of such varieties as Mermet, Bride, Gontier, Perle and Beauty. Here we meet with a number of plants of the climbing form of the Perle just breaking into bloom. "But," says Mr. George Hild, "it don't pay to grow. These are the first flowers that have showed this winter. It will yield a heavy crop in spring, but what is the use when you get no result during the season when the flowers have any value?"

Calvert & Sons grow in addition to cutflowers a line of miscellaneous plants. We noted particularly a finely grown batch of campanulas, mostly in full bloom, making a splendid show. Also a very fine lot of Harrisii with from 10 to 12 blooms on the stalk, which is quite remarkable from the fact that these are produced from small bulbs, 5 to 7 inch. The blooms too are very large and of firm texture.

The range of rose houses, with the exception of Beauties, look well. Bridesmaid is to the front here also. Two benches of these plants are in fine crop and are in every way considered most satisfactory by Mr. C.

Looking through the rose houses Mr. Calvert called our attention to two different sections of a bench each containing about two dozen plants, one of Perles and the other Mermets, which looked sickly and stunted, while on either side of them the same varieties grew strong and thrifty. "I did some little experimenting," explains Mr. C., "I thought I would try how much manure a rose will stand, so last fall I filled in this section of the tables with about an inch of cow manure in the bottom; on this was placed the regular rose soil. Well all I can say is, that it isn't likely I shall try it again."

An interesting piece of machinery in use here is an electric vapor force pump. The motive power is furnished by a small electric battery which developes a vapor from gasoline which is led by means of a pipe from a tank containing about a barrel of the oil to the machine. The pump can be started up at a minute's notice by simply giving a few rapid turns to the flywheel which sets the battery in motion. We are not electrician nor machinist enough to describe this apparatus in detail, although it is very simple. The cost of operating the pump is very small, estimated at about 5 cents a day by Mr. C., and in every way as efficient as steam power.

We are glad to see Mr. Fred. Andermann back at his post again in much improved health, after an absence of about 5 months spent at the sanitarium at Battle Creek, Mich. Owing to Mr. A.'s inability to superintend the affairs of his establishment personally, the roses this season have not done as well as we have been accustomed to see them in former years, but there is a fine showing for a good crop this spring, particularly in Perles, Goatiers and La France.

Mr. A. also contemplates making a change in his mode of heating by adopting the overhead flow system.

Fern Spores.

The most satisfactory method of keeping up a supply of small ferns for filling fern pans and for mantel decorations, is by means of successive sowings of home grown spores in such quantities as one's trade demands. And in order to furnish the necessary spores for this purpose a few plants of each of the most suitable species and varieties should be grown on into moderate sized specimens, 6-inch pots being large enough for most of them.

The plants selected for this use should be given plenty of ventilation and not too heavy shading in order to secure a strong and sturdy growth, for when these stock plants make a soft and flabby growth the yield of spores is not nearly so large, nor do they ripen so rapidly. Some spores will doubtless be dropped before the fronds are gathered, and these self-sown spores may be made to contribute to the general stock by spreading some loam or even clay among the plants on the bench, this being quite a congenial material for the stray spores to germinate on, and has frequently given very satisfactory results with Adiantum cuneatum especially, the young seedlings being carefully removed in small clusters from the clay and pricked out into pans or boxes as soon as they become large enough to be handled.

It is a somewhat difficult matter to lay down rules for the gathering of fern spores, close observation and experience being needed to insure success, for while some imperfectly ripened spores will probably germinate (as will many other unripe seeds), yet it is quite possible that the seedlings will not develop beyond the embryo form, or prothallus, and thus valuable space, time and patience may be wasted while waiting for further growth of such seedlings. But it is usually a safe guide to watch for the opening of the spore cases, and for a slightly dusty appearance of the fruit dots or collections of spores of whatever form. It is then good practice to gather the whole frond, or as many of them as appear in that condition, and to wrap them up in some clean paper and then place the package in a dry and moderately warm place until the fronds are quite dry and ready for cleaning up, the time required for this drying varying with the conditions of weather and surroundings. By the time the fronds are quite dry and brittle, most of the spores will be found to be discharged from their cases into the paper, and will require no further cleaning, but as some will still adhere to the fronds it is aa economical method to rub the frond between the hands in order to remove the remaining spores, and then to pass the product through a very fine sieve, one with No. 40 mesh being well adapted for the purpose, and will retain nearly all the rubbish. The spores should then be poured into small vials such as those used for homeopathic remedies, and corked up, when they may be kept in good condition for a considerable length of time, some species germinating freely after several years storage. This bottling method is a neat and satisfactory way to pack the spores away until they are needed, and is much superior to the plan of putting them away in paper packages.

There is naturally considerable variation in the time of germination of different species of fern spores, the strong and rapid growers, for instance, some of the pteris, are among the quickest to show signs of growth in the seed pan, a week or two sufficing to prove their vitality in the springtime, while some other species may take five or six weeks to show as much progress. It is not yet too late to sow some of the strong growing kinds in readiness for next winter's trade, Adiantum cuneatum, Pteris cretica in variety, P. serrulata and Onychium Japonicum all having time enough to make salable stock yet, in fact the prevailing style of fern pan demands quite small plants in order to produce the best effect, and if the pteris are sown too early they may become too tall for the purpose. The spores should be sown on the surface of some fine soil, the soil being made moderately firm before sowing, and 6-inch pans or pots are the most suitable size in which to sow.

In after treatment it may be added that the seed pots should never be allowed to become dry, but be kept uniformly moist by watering from the bottom, at the same time protecting them from sunshine and keeping a night temperature of 65°, and as soon as the spores have germinated admitting sufficient ventilation to remove surplus moisture and prevent damping off.

W. H. TAPLIN.

OBITUARY.

MYRON A. HUNT.

We deeply regret to have to announce the death of Myron A. Hunt at his home in Terre Haute, Ind., the morning of April 23d. Mr. Hunt took his own life during a fit of temporary insanity brought on by several months of illness and by great anxiety for his wife, who has been pronounced hopelessly insane.

As is well known to all in the trade Mr. Hunt has been treasurer of the Society of American Florists since its organization nearly 10 years ago. He was also at the time of his death president of the American Rose Society, treasurer of the Florists' Hail Association, and also of the National Chrysanthemum Society of America. He was of a genial, kindly nature and not only made friends readily but retained them, and his friends and admirers in the trade were legion. At the last convention of the S. A. F. he was nominated for the presidency but declined the honor, as he preferred to continue to serve the society in the office with the work of which he was so familiar.

Mr. Hunt was born at Sunderland, Mass., in 1838 and was 56 years of age at the time of his death. In 1870 he came to Chicago, entered into partnership with Mr. George Miller under the firm name of Miller & Hunt, and devoted himself to the growing of early vegetables for the Chicago market. In 1875 the firm entered the florist's business, devoting their glass to the growing of plants for the catalogue trade, in which they were the pioneers in that section. They did a large business, growing much stock for the wholesale trade also, and in addition conducted a pottery for the manufacture of flower pots in connection with their other business. They also established a large greenhouse plant at Terre Haute, Ind., for the growing of cut flowers for the Chicago market, finding there better soil and cheaper fuel than were to be had nearer the latter city. In 1881 the partnership was dissolved, Mr. Miller retaining the Chicago establishment and the wholesale shipping trade in plants, and Mr. Hunt taking the Terre Haute plant and the catalogue mail trade. Later on Mr. Hunt disposed of his catalogue business and gave all his attention to the growing of cut flowers, mainly roses, and his stock was an important factor in the Chicago market.

He was one of the few who bore the brunt of the work incidental to the organization of the Society of American Florists, and was tireless in his efforts to advance the interests of that body in its early days when support and encouragement were so essential to its existence, as well as in the later years of success and prosperity.

His book "How to grow cut flowers," which was a simple relation of his own practical experience in his chosen field, met with immediate success, and a new and revised edition was issued not long since.

He was a man of rigid integrity, devoted to the principles he exemplified in his daily life, of great kindness of heart and generosity. He was a consistent Christian gentleman in all that the term implies.

In addition to his widow, whose sad affliction was largely the cause of the fit of despondency in which his own life was cut short, seven children survive him.

THE LATE MYRON A. HUNT.

The oldest, a daughter, is married. The next oldest is a son aged 20, upon whom will probably devolve the carrying on of the business.

The funeral was held Thursday, the 26th inst., and was attended by many friends in the trade from a distance, and the various trade organizations with which he was so prominently connected were represented by suitable floral emblems expressive of the grief felt at his death and sympathy for his family in their great affliction.

Mr. H. B. Beatty, Oil City, Pa., secretary of the Florists' Protective Association and of the American Rose Society telegraphs us as follows:

"I am deeply shocked and grieved at the death of M. A. Hunt. Floriculture loses a devoted, talented and enthusiastic lover; the Society of American Florists a firm supporter and valued councilor, and we all a firm and loving friend. Convey my heartfelt sympathy to bereaved ones."

And we know that Mr. Beatty has voiced the feelings of every one in the trade.

Miscellaneous Seasonable Hints.

The general florist is not supposed to be in the tree and shrub business, but he will nevertheless get called upon to supply a good many articles that are not greenhouse plants, and it pays him to be able to supply his customers with many desirable things at a fair paying price, which he can handle without much outside room, and which the tree peddler would charge treble the price for, regardless of whether it ever grew or not. It will help you very much to get your customers supplied at once (providing they want them) with all herbaceous plants, flowering shrubs, if you handle them, clematis, Ampelopsis Veitchii, in fact all hardy deciduous plants. When you can get all these little wants attended to you won't be bothered with them when the grand rush is on at the end of May; besides that it is the right time to plant them.

Your customers should be told that now, or even earlier, is the time to plant pansies, and not wait until the hot weather arrives, when coleus thrive out of doors. It is your duty to let your customers know these facts, for, simple as they are, it is surprising the amount of ignorance which prevails on such subjects among ordinary intelligent people.

This is a most critical time with most soft wooded plants and will need the exercise of much more brains and care to keep everything in good growing condition than was required in midwinter, when you were bound to keep a good fire. In this latitude it is poor policy to give up fire heat, unless extraordinary warm weather occurs, before the middle of May. The proper way to manage is to get all the plants that must have fire heat into a house or houses by themselves, and those that can with good management do without artificial heat into other houses. Geraniums and the show pelargoniums, if they have been grown with plenty of air and light, can get along fairly well without fire heat, providing they have plenty of air night and day and no shade on the glass, and so can many others of the cool greenhouse plants. Coleus, if deprived of a genial heat before the middle of May, or before the temperature stands steadily at 65° every night, will stand still, and even then a dampness exists without fire heat which is very detrimental to many plants. Try and get your coleus, acalypha, caladiums, cannas and all such plants where they can have a little fire heat for several weeks longer, but don't forget plenty of air at the same time. Fire heat won't make them soft, if you have plenty of light and ventilation.

You will soon have most of your spring stock potted into their last shift before selling. It is no waste of time to do a good deal of setting over, and with many plants it is highly necessary. They are growing fast now, and will be quickly injured if allowed to remain crowded. It is a small expense to stand over one thousand 4-inch geraniums, say one dollar, and this you will get back tenfold in the superior quality of the plants when given the proper space.

Don't let your zonal geraniums flower themselves to death before selling time. If you can't use the flowers for cheap bunches of flowers then break them off and throw away.

There is only one place for that beautiful plant, the lobelia in 3-inch pots, and that is a shelf or edge of a bench. They may not last all summer, but they are indispensable in a vase or veranda box.

The hotbeds will help relieve you very much in bench room, and a mild hotbed even if filled as late as May 1, will bring along many plants far better than a greenhouse. Here is a list of what I put into the hotbeds: Alternanthera, sweet alyssum, satolina, heliotrope, tuberoses, verbenas, variegated and bronze geraniums, coleus late crop rose geraniums, lemon verbena, petunias, mignonette, and others if I get crowded.

Have you seen Cytisus Andreanus? It is a most attractive plant, and I predict for it a popular time as a pot plant, even if it be a brief time. In habit it is very like the common English broom, but its flowers are as gay as Mimulus maculosus. It can be bought of any of the gentlemen who send you azaleas and lilac, and is bound to sell for a year or two.

WILLIAM SCOTT.

Nephrolepis exaltata and Rubbers.

ED. AM. FLORIST: I would like to know from some of the readers of your paper how the stock of Nephrolepis exaltata is increased, what kind of soil they are best adapted to, what temperature they require and if they want bottom heat.

Also how to propagate the rubber plant to have nice plants for fall sale, and what temperature they ought to have after they are propagated. R. M.

Nephrolepis exaltata is propagated either from spores or by division, and for the latter purpose it is a good plan to plant out a few plants on a bench in the greenhouse, using ordinary potting soil, and shading the glass over the plants. In a short time they will begin to throw out rhizomes somewhat like strawberry runners, and these will soon produce young plants which should be cut off and potted up, but will need to be kept rather close and well shaded until they become established. The temperature of a rose house will be a satisfactory one for the nephrolepis.

Cuttings of rubber plants (Ficus elastica) usually root readily at this season, provided they are put in a propagating frame in which a steady bottom heat is

maintained, single joint cuttings being the most reliable to use in this method of propagation. The other method of increase, namely, by topping, gives much more shapely plants than the single eye cuttings, and is done by cutting the shoot half through and then binding up the wound with damp moss, the plants being kept in a warm house. Grow on the young plants in a temperature of about 70°, with a light shading on the house, and about Aug. 1st the plants may be put outdoors to harden off. W. H. T.

Caladiums.

This genus of highly ornamental plants is of very easy growth, and very useful for decorative purposes in summer. especially so to the amateur whose houses are stripped of plants at that season, the majority of greenhouse decorative plants being used for the purpose of outside work. At that season the caladiums fill the houses with a mass of brilliant color, which cannot be produced by any other plant. In the warmest weather they can be used out of doors with good effect, but it is best to grow them inside.

Caladiums should be grown in a mixture of turfy loam, peat, leaf mould, and well decomposed manure in about equal parts, adding some sand. Give the pots plenty of drainage, as they like an abundant supply of water, also a strong heat. The size of pots and the number of times that the plants are shifted should depend on the size of plants required; if only small plants are needed don't make the soil too rich, and keep in small pots, but if large specimens are the object it is scarcely possible to be too liberal to them in the matter of potting and feeding. As the beauty of the foliage begins to fade, less water should be given, gradually decreasing the supply until it is entirely withheld, then place the pots on their sides under the bench in a warm greenhouse, and occasionally if they get dust dry give a watering over the pots and to the soil that the pots lay on and they will come out all right in spring. If they get too dry some of them, especially the small rooting varieties, will be attacked with dry-rot, and when turned out for potting in spring nothing but the out side shell of the bulb remains.

They should be potted as soon as they start to grow in spring. They should first be potted in small pots and shifted as needed. They are increased by division of the tubers, taking care to have an eye with each piece; when divided dip the cut part of the tuber in plaster or air-slacked lime to prevent rot, and start in a good bottom heat. Many of the varieties have been introduced from Brazil and others are greenhouse hybrids.

Caladium argyrites is the smallest and most beautiful of the species. It is a beautiful little gem for any decorative purposes. The leaves are small, light green for the ground color, center and edges of leaf white, the remainder of leaf irregularly blotched and spotted with white.

C. Chantinii is a very robust and handsome variety the greater portion of the leaf crimson, blotched with white and margin of leaf dark green. C. Belleymeii, a fine species with large sagittate leaves, is nearly all white, the veins of the leaves forming a bright green network, sometimes tinged with pink. C. Meyerbeer is a garden hybrid somewhat of the style of Belleymeii but much superior to it. The ground color is white, the veins bright green and mid-rib deep red.

C. Wightii, a handsome and distinct variety; the leaves are large and broad, rich deep green, profusely dotted with spots of white and bright red, but neither colors are mixed together. C. Verschaffeltii; a rather dwarf grower with large heart-shaped leaves; the ground color bright green spotted bright red. C. Wallisii has dark green leaves, spotted pure white and the veins yellowish white. C. mirabile, a distinct and desirable variety with large broad leaves, ground color light green, spotted pure white. C. Reine Victoria is handsome; the margin and veins bright green and the ground white, marbled with rich crimson.

C. Emperor Napoleon, very showy, the center of the leaves flame color, the margin bright green spotted with carmine. C. Chelsonii, large leaves, center rose dotted with silvery spots, the rest of the leaves bright red and vermilion margined with deep green. A handsome and distinct variety. C. Baraquinii is very distinct and strong growing, the leaves very large, center of leaf deep red margined with green.

There are a great many garden hybrids not named here, some of them very distinct, and many of them similar in many respects to the older varieties. Amongst the new fancy hybrids that have been imported from Rio Janeiro of late years there are some wonderfully fine varieties, and it would pay any florist to grow a collection of them if only to make a show in his houses in the slack season, but I have found them to be a good plant for the retail trade in summer. JAS. S. TAPLIN.

Hackensack, N. J.

Antirrhinum Majus.

Nearly every one is familiar with the old fashioned snapdragon, Antirrhinum majus, as a garden flower, but few are aware of its merits as a cut flower for winter use. They produce much finer spikes under glass than they do in the open ground, as the illustration shows. The pure white, the different shades of yellow and the crimsons are the most useful colors; the white varieties being particularly so as they are very effective in funeral work, having much the same effect as fine orchids.

They grow readily from seed and when in flower the clear colors can be selected and cuttings taken from them; thus choice varieties may be continued from year to year and any quantity of any particular variety or color can be easily grown.

They make a very useful thing to put in after chrysanthemums, giving great quantities of flowers all through the late winter months. For this purpose cuttings may be struck in March or April and planted in the open ground during summer, or they may be struck in July and kept in small pots until they can be planted in the chrysanthemum beds. The early struck cuttings will give an earlier crop of flowers but they are not so easily handled as the latter.

For striking the cuttings a cool overhead temperature with gentle bottom heat will be found best and for growing the plants a temperature which will suit the carnation is just suited to them.

A. H. FEWKES.

Cool Growing.

Mr. W. R. Smith is a strong advocate of cool growing. Many of our greenhouse and stove plants (so called) he believes we seldom see in their best form, owing to the excessively high temperature in which they are commonly cultivated, and claims that we have still much to learn on this subject, as the name of the country from which a plant is introduced is not an exact guide, elevation being equivalent to latitude.

Among the numerous plants which he instances as proving in practice his theory is the well known Ficus Parcelli, everywhere classed as a stove plant, but which in his cool culture is less rank and coarse, and is much prettier than when grown at a high temperature.

Franciscea latifolia, with its beautiful blue and white flowers, although classed as a stove plant thrives much better in a cool house. Stromanthe (Phrynium) sanguineum when grown cool makes an elegant decorative plant and always blooms best when it gets plenty of air. Inga pulcherrima, the "Tassel Flower" of Mexico, seeds abundantly in full sunlight with a plentiful circulation of cool air, whereas under different circumstances, although it flowers well enough, no seed is produced.

Miconia Peruviana is a plant which Mr. Smith recommends as valuable for table decorative purposes if grown in a cool house.

Glazing.

The writer will have considerable glazing to do this coming season and desires to know the best, quickest and cheapest way to do it. Is there any saving in butting the glass, and does it give as good satisfaction as lapping? Is 14-inch width double strength glass as strong as 12 inch, and preferable to 16-inch?

SUBSCRIBER.

In reply to above there is nothing better than the regular way of glazing, with a good quality of putty, well bedded on the bars and the glass pressed down solidly into the same. Clean it off on the top smooth, fasten the glass in position with either well galvanized triangular points or zinc shoe brads; the latter are put in a little quicker than the other. In using the latter it is better to drive the bottom ones one-quarter of an inch below the top edge of the last light of glass put in before bedding the last glass in, pressing the same on the lower bars and when in position put two or four more, according to the size of the glass, one near the bottom edge and another a little nearer the middle if the glass is long.

To put the putty on with I have never seen anything better than an old table knife with the handle slightly bent back and the blade six or seven inches long, the edge ground off square instead of sharp. With this take a large slice of putty from the hand and cut it on; in other words put it on with the knife. A very little practice will make this a quick operation and a good quick, smart boy can bed putty as fast as two men can glaze behind him after he once gets into the practice of doing it.

About a quarter inch lap is good enough for all purposes and is really very much better than butting the glass; the trouble with the latter is that unless the glass is cut very true, there are cracks, one being above the other, which is sure to cause a good deal of leakage.

With reference to size of glass, double thick glass 16 inches wide and 20 to 24 inches long is really the best glass to use. The only objection that has been advanced so far that I have heard is that it costs more to repair when a light gets broken; 14 by 20 to 24 costs a little less than if two inches wider, this is the only objection that can be raised against it. It is strong

VASE OF ANTIRRHINUM MAJUS, PURE WHITE.

enough in all reason to stand any pressure brought to bear against it and makes the house that much lighter. One other important item is be sure that the wood has a good coating of paint on before glazing and the beveled rabbet of the bars well filled with putty; this is a great help to keep the putty under the glass, whereas when they are ploughed level the putty is sure to work out after a few years. We have houses here glazed under the beveled rabbet system and the putty is as sound as when put in, for the very reason that it cannot get out. Another very important item is just as soon as the putty gets set have a good coat of paint put on the outside before any bad weather gets an opportunity of working on the putty. A great deal depends upon the ability of doing this work quickly and upon the adaptibility of the operator to catch any improved method that may suggest itself as he goes along. Some A 1 glazers that I have employed here have been able to lay five hundred square feet of glass in ten hours without any apparently great effort, while others, calling themselves first-class glazers, have not been able to do much more than half that amount and not do the work any better either.

JOHN N. MAY.

Easter Reflections.

Reviewing the full returns from the entire country we note with much satisfaction that notwithstanding the general depression, Easter trade in a majority of instances exceeded that of any former season. This welcome repetition of the unvarying experience as recorded for each and every year since the AMERICAN FLORIST inaugurated these reports seven or eight years ago, furnishes an impressive illustration of the wonderful growth of the Easter trade. Plainly we have not yet reached the limit of Easter possibilities, and when we have been able to surpass all records this year may we not reasonably count upon piling it up a little higher next year?

So much for the extent of the trade; but there is another point which we cannot overlook, one which is also in line with the experience of past years, which is that Easter prices are still tending downward. Prices are in some degree affected by the date of the occasion, and there have been fluctuations resulting from the varying popularity of certain flowers, but waiving these exceptions the fact is that the drift has been unmistakably downward.

It is pertinent to enquire how long this tendency will continue and how much more of it the trade can stand. A large commission dealer was once heard to remark when discussing the low prices prevailing during an after Easter relapse, "It's strange, but the growers seem actually better satisfied with two cents for their roses now than they are with ten cents at Easter." But now that Easter can no longer be safely counted upon to bring to the grower extra profits sufficient to overcome any deficiency resulting from unprofitable returns at other times, and the "ten cents at Easter" is no longer forthcoming, the "two cents now" will not be regarded with so much complacency.

Plainly, the grower will hereafter need to proceed cautiously in determining as to what he will grow and what quantity of certain things the market will take without overstocking, whether for general trade or for Easter; for although the market is constantly increasing yet the steady shrinkage in prices indicates that the production is more than keeping pace with the increasing market, and as the margin of profit gets narrower the risk from miscalculation in deciding as to what and how much to grow becomes correspondingly greater. Our weekly reports from the larger cities are good indexes to the tendencies of the demand, and a grower who carefully studies these reports and bases his preparations upon the information gained therefrom will not be likely to go astray.

New York.

Growers and wholesalers find fault with the prices obtained for roses, and with good reason. There is entirely too much stock in the market for the limited demand, and the result is that while a small percentage is sold at tolerable prices the great bulk of the supply has to be unloaded at prices that are ridiculously low, five to ten dollars per thousand for all varieties as they run being the prevailing figure, and that even obtained with difficulty.

Carnations fare much better and the growers of carnations must be doing fairly well with the returns which their stock has been and is now bringing. Looking the subject over carefully, the only reasonable conclusion must be that there is too much glass devoted to rose growing in this vicinity, and the only reason for the better condition of the carnation market must be that the quantity of these flowers produced is more nearly balanced with the demand which exists. The great danger to the carnation industry lies in the probability of a stampede in that direction, of disgusted rose growers and others, in which case the carnation will get into the same box which the rose is in at present.

To decide as to the best use of the surplus glass for next year is a difficult matter. Bulb forcing offers no inducements, the trouble in that industry resulting not alone from overproduction, but also from a change of fancy in the buyers. Violets, chrysanthemums, hybrid roses, orchids, smilax, in fact everything which may be regarded as staple all have given evidence of being overdone the past season. The only field available is in novelties and this line is full of risk.

The quality of stock coming in at present is fairly good in roses. American Beauty has improved greatly within a short time, but it sells poorly. Violets are showing the effects of the spring weather and a few more warm days will finish them. The lilies coming in now are mostly longiflorums, Harrisiis being about at an end. Lily of the valley is very good, but no demand. Of other bulbous stock there is little seen, and lilacs have passed their best. Sweet peas in fair quantity and finest quality, white from J. J. Blauvelt, and Blanche Ferry from several growers are coming in to Burns & Raynor and are selling well.

The Mrs. Whitney rose is showing up in fine shape at J. N. May's. The grand foliage and rich red stems of this variety secure for it a high place among roses and its fragrance is unexcelled. Mr. May will have something new in the carnation line to show next season. He reports the demand for young roses, chrysanthe-

mums and carnations as fully up to the average this season.

On Saturday last several Broadway establishments, including certain well known florists, were cleverly taken in by a chap who worked an ingenious scheme for replenishing his cash pocket. Running into the store in hot haste and all out of breath he would announce that a cable car down street had run into and demolished a fine wagon bearing the name of the proprietor and that he had come at the request of the driver to report the fact and procure assistance. In each case he received a generous tip for his valuable services, but after the strictest search no broken team could be found, and the kind young man had likewise vanished.

August Rolker & Sons state that the paper flower pots have proved the best selling article in their store this spring.

The mother of J. W. Scallen, the Broadway florist, died on Friday, April 20, of pneumonia.

The executive committee of the Florists' Club are wrestling with the chrysanthemum show problem and the selection of a superintendent for the same.

Mr. Theo. Outerbridge of Bermuda is in town looking after lily bulb trade and incidentally endeavoring to explain the Bermuda Easter flower folly.

Sander's auction sale of orchids was a big success.

Chicago.

Has the past season been a profitable one to the dealer? That the present hard times have materially affected the cut flower trade admits of no doubt, and we could therefore not expect to record any increase in the amount of sales, as has been invariably the case in former years. The dealer who held his own this year may consider that he has done remarkably well. We subjoin a few remarks on the trade by some of our leading retail men in the downtown district. This locality differs largely from that situated in residence portions of the city (of which we shall speak later) in so far, that here our transient population who patronize the downtown hotels are quite an important part, and here also is felt most keenly the presence of the fakir.

Says M. F. Gallagher: "The business in the early part of the season up to Christmas was most discouragingly slow, and up to that time ran considerably behind last year. From the time the Fair closed and up to the first of the year the transient trade was dead. This was accounted for to a large extent by the fact that our large hotels were almost deserted at that time. Starting in with a first-class holiday trade business after that has steadily improved. The amount of sales are not quite equal to the last two years, but considering the times, quite satisfactory, and really better than was anticipated. I notice one feature of my business which is most gratifying, and that is a decided increase in the amount of cash sales in proportion to book accounts. We have had but few orders for large and costly decorations this season; most buyers are very conservative in their orders. The largest sales made are in the box trade and funeral work."

"Have you found any difficulty in securing the kind of stock called for?" "Yes mostly in the better class of roses, particularly Beauties. Of the latter I think that Chicago could use twice as many as are offered in the market. Violets too have run short for months at a time."

But let us drop in on our friend Joe Curran. "Well Joe, how is business?" "Rotten," is the prompt and characteristic reply. "But how does the season compare with former years?" "Business has been very quiet. Transient trade is not as good as last year, and orders for luncheon and dinner parties, on which I depend a good deal, have been few and far between. The holiday trade, both at Christmas and Easter, has been very good, and as the price of flowers was quite reasonable, the business proved fairly profitable. There has been little or no complaint about extortionate prices this year, owing to the fact that flowers could be offered at reasonable rates. It is doubtless owing to this fact that such a large amount of business was done notwithstanding the general hard times. The extreme fluctuation of prices at holiday times is very detrimental to business, and the sooner this is done away with the better it will be for all parties. The call for Beauties and the larger varieties of roses is constantly increasing and the supply was often short of demand. The same is true of violets."

Walter Kreitling tells nearly the same story. The aggregate amount of business done was less than last year; transient trade very quiet, demand for funeral work fairly good, but the absence of large orders for decorations is most noted.

Phil Hauswirth reports a fair trade for the season, though not quite as good as last year. Transient business very light. But as this establishment is situated pretty well uptown, not much is depended on in this line. Orders for decorations have been quite numerous, but on a rather smaller scale than former seasons. "How are orchids selling this season?" "The demand for orchids," replies Phil, "is increasing every year. I have handled a good many of them this year. I feel safe nowadays in taking orders for them, since there is little difficulty in getting them in quantity. Cattleyas of course take the lead, in fact the demand is limited almost entirely to cattleyas, with the exception of Odontoglossum crispum and a few forms of dendrobium and phælenopsis; few others are called for. Cypripedium won't sell at all."

O. J. Friedman reports a satisfactory trade, but as this establishment came into existence only last fall, no comparison can be drawn with former seasons. Mr. John Thorpe, who is connected with this house, says: "We found it often quite difficult to meet the demand for high class roses and fancy carnations, and often had to send long distances to procure what we wanted. The average stock sold in our market doesn't meet the wants of the customers. The demand for fancy carnations is particularly noticeable; there is no difficulty in getting good prices for a select article."

Chas. Fisk is located on State St., right in the very midst of the fakir. Says Mr. F.: "The business this season has been very poor. I notice a great falling off in trade from last year. I depend largely on transient business and this is affected greatly in my locality by the street vendors who fairly ruin my trade."

Mr. Andrew Miller, who manages the affairs of the Central Floral Co., reports a very fair trade for the season, but nevertheless business has not been as good as last season. He also complains of the presence of the fakir being detrimental to his trade to a marked degree.

The market last week was in a sadly demoralized condition. The glut of roses continued throughout the week, and meeting with no improved local demand prices were carried down to the lowest point yet reported. Large quantities, in job lots, were disposed of at $5 to $6 per 1000; $10 to $15 per 1000 bought a very good grade of stock, with $2 per 100 for selected; this later figure was sustained for all good stock sold in small quantities. Hybrids brought from $10 to $15, and Jacques $8 to $12. Beauties are quite plenty but no glut, $15 to $18 for good long stemmed, with a choice lot occasionally at $25.

On Monday this week the market opened in a much improved condition; the worst of the glut is apparently over and prices show a tendency to stiffen; no stock, if in good condition, is offered for less than $2, a number of the wholesale men being sold out clean before noon.

Carnations hold steady at $1 for good common sorts. Some extraordinary heavy shipments were made to outside points, which helped greatly to ease up the market on this flower. Kennicott Bros. Co. report a sale of 40,000 flowers in one shipment. Corbrey & McKellar, J. B. Deamud & Co., and the Niles Centre Co., also report shipments of from 10,000 to 15,000 at one clip.

Harrisii is badly overstocked; good stock is selling at $4. Prices of all other stock remains about the same as last week.

Arbutus has made its appearance again and seems as popular as ever; but no great quantity is on our market yet.

Fire caused a serious loss at the establishment of George Miller, at Hinsdale, about midnight on Sunday last. The fire started in the vicinity of the boiler room, which is situated at one end of a wide shed running through and dividing the two sections of houses, which open on either side of this shed. Although the fire was discovered almost as soon as it started the highly inflammable material in the shape of lumber, boxes, etc., aided by the presence near the boilers of a barrel of gasoline, which was accidentally or carelessly left with the faucet open allowing the dangerous fluid to escape (which probably caused the conflagration), made it a difficult matter to fight the fire successfully, and in a very short space of time the entire shed and the section of houses adjoining on either side, for a distance of from 20 to 40 feet, were destroyed. The loss on stock is of course almost total, and is estimated by Mr. Miller at $8,000, and the damage to buildings at $2,000. There is no insurance. Mr. Miller, in his attempts to check the flames, had his face scorched and both hands badly burned.

A judgment creditor has filed a bill for a receiver for the business of M. F. Gallagher, the Wabash Ave. florist. The *Herald* of April 21 prints the following: "A bill for a receiver to take possession of the business of Michael F. Gallagher, the florist, and the Gallagher Floral Company, has been filed in the circuit court by Thomas Kelly. Kelly is a creditor on a judgment for $856, recovered June 26, '93, by Clara Catherwood, the judgment being subsequently purchased by Kelly, who had guaranteed Gallagher's note. The bill alleges that Mr. Gallagher has assigned portions of his property in Hyde Park for the purpose of defrauding his creditors to Mary Gallagher, his wife, and John Schubert, both of whom are made co-defendants. The defendant, Gallagher, obtained the concession for the sale of cut flowers and plants at the World's Fair, and May 22, 1893, organized the Gallagher Floral Company, with a capital stock of $20,000. Into this corporation, the bill states, he merged his entire business and this concession in payment of its capital

stock. Kelly avers this was done for the sole purpose of delaying creditors in recovering judgments. It is stated that $10,000 of the stock was subscribed for nominally by Mrs. Gallagher, but in reality as a secret trust for her husband. For these reasons the court is asked to appoint a receiver, that all creditors may be satisfied."

Among recent visitors were K. J. Kuyk, Hillegom, Holland; N. T. Raulino, representing E. Kruyff, Sassenheim, Holland; J. B. Van der Schoot, Hillegom, Holland.

The news of the sudden death of Myron A. Hunt was received with universal sorrow in this city. As is well known, Mr. Hunt was for many years a prominent member of the trade here, and was highly esteemed by all. The Florists' Club, of which Mr. Hunt was an honorary member, sent a suitable floral arrangement to the funeral, as an expression of its sentiments towards one always held in highest regard by its members.

Philadelphia.

The April meeting of the Pennsylvania Horticultural Society held last Tuesday evening was most interesting to friends of the society who are interested in seeing the hall rebuilt. If the present plans are carried out and everything seems to be propitious, the new building will soon be under way. A number of wealthy gentlemen stand ready as soon as the trustees acceept their proposition to advance $100,000, and this with some $30,000 the trustees have in hand and some $40,000 or $50,000 to be raised from among the members of the society in $50 bonds, will place this time honored society among the best endowed institutions of its kind in the world. The borrowed money is to be no lien on the property, only the earnings after expenses are paid being called on to pay 3 per cent. interest and 2 per cent. a year into a sinking fund to gradually retire the bonds. The trustees have been offered close upon $300,000 for the ground and some of them think it best to sell and invest this money, but the attorney for the society, Mr. Price, a very high legal authority, says no, the deed of trust directs that when the Society vacates the property it shall revert to the heirs, and although Messrs. Schaffer, who would inherit, have given them permission to sell, it might place the property in jeapordy and his advice was to hold on and not sell if they could avoid it. Acting on his opinion and the feeling of a majority of the members that a fine building and little revenue would be more advantageous than simply a revenue from a fund invested and practically no hall or place that the society could call its own the members directed, by resolution passed unanimously, that it was their desire that the trustees accept the offer of $100,000 and also directed them to cooperate with this committee of gentlemen and adopt plans looking to the erection of the building as soon as possible.

It is estimated that the property when finished will be worth $500,000. The main auditorium is to be as complete as modern ingenuity can make it, while above this is to be a grand dancing hall, with retiring rooms, also a first-class kitchen. The lighting is to be done by electricity from a plant on the premises. As the meeting progressed one could almost see the hall rising Phœnix-like from its ashes. Robert Craig said at a small adjourned meeting later, when some one wondered how it was that the gentlemen with the hundred thousand would agree to lend this large amount without security, that they were all right, they could see that such a building as they proposed to erect would easily pay 3 per cent. on $200,000. The society furnishes the site, worth $300,000 for the use of the building when they needed it and while for a few years there might not be much revenue for the society they would come out all right in the end. "We have voted to-night," said he, "for poverty and glory, but as the society is self sustaining now, without any revenue from the hall, with this fine building and its prospective earnings the future looks very bright."

On the president's desk was a vase of Helen Keller, fine blooms, and a plant in flower of Cypripedium lævigatum, a very unique and curious looking variety, both exhibited by Edwin Lonsdale.

All the boxes, baskets and wagon extensions of the growers are now called into use daily to transport the stock now coming in. Everything is plenty save Brunners, which are off crop and nearly done for a little while. Beauties, particularly short stemmed ones, are very plentiful and are now the cream of the fakirs stock; very good flowers are offered on almost any street corner at four for a quarter, and sometimes it is six. Very good roses have been sold for from 25 to 50 cents per 100. Anything is taken rather than carry the stock home.

The wholesale prices to the stores for choice large teas is from $4 to $6 per 100, smaller class $2 to $3. Best Beauties $2 to $3 per dozen; best hybrids $3 to $4 per dozen; carnations $1.50 for good stock, $2 to $3 for the fancies; sweet peas $1.50 to $2.50 per 100.

The Wanamaker store is going into rose bushes. Their advertisement says: "Roses at 15 to 20 cents each, that are usually sold by florists for $1 to $1.50." The kind they offer is the dormant imported stock. They don't seem to have made much of a success of their cut flower department, as little is heard of it from customers.

Planting out season is now here and bedding plants are to be seen in large quantities among the growers who make a specialty of this kind of stock. K.

Boston.

The retailers are unanimous in pronouncing the present to be a very unsatisfactory month, and by no means up to the average for April. The prevailing prices of flowers have not been a true index to the state of trade, for a long spell of weather both cold and dark curtailed production and prices held up better than the demand would warrant. During the past week warm spring weather has prevailed and the effect has been felt already by the roses and violets. Prices on the former have become demoralized and the latter have suddenly grown small and poor, a sure indication that the end of the violet for this season is close at hand.

The conditions which produce this result on the Marie Louise have a contrary effect on the English or Cape violet, which is just beginning now to come in in quantity, and the Marie Louise looks pretty tired along side of the splendid deep purple of these flowers. But their season is a short one and a few weeks will finish them up, also. Trailing arbutus is to be seen everywhere and its abundance and popularity have not a little to do with the stagnation noticed in other lines. The carnation alone seems to hold its ground and up to date shows no sign of weakening, good Daybreaks, Buttercups, etc., going briskly all the way from three to five dollars per hundred, according to quality, while ordinary sorts seldom run under two dollars per hundred. Marguerites and primroses seem to enjoy especial favor this spring for street wear.

Patriots' Day, April 19, was observed with great enthusiasm throughout the state. In no instance probably was the occasion more uproariously celebrated than at "The Breakers," Ed. Hatch's cottage by the sea at Scituate. There have been some good times in the past at this famous retreat but this one threw all the rest into the shade. The company was the same galaxy which has often on similar occasion done justice to Mr. Hatch's hospitality. It was too early for corn and cucumbers, but clams and lobsters are always ripe and appetites always in bloom at Scituate. It was a great combination; Hatch, surf, Norton, clams, Hoitt, eloquence, Welch, patriotism, Ewell, harmonica, Cox, High-low-Jack, Annie Laurie and various other personages and ingredients too numerous to mention, including C. H. Joosten from New York, who from all appearances enjoyed to the utmost his initiation into the mysteries and the glories of Old Colony life.

The spring plant auctions are fully under way; McCarthy and Hatch have both had sales of roses, clematises and other dormant stock, and satisfactory prices were obtained all round.

C. J. Dawson, of the Bussey Institution, has exhibited cut blooms and plants of Cypripedium spectabile on several occasions lately and they have been much admired. This most beautiful of native orchids is very abundant in some sections and can be bought in quantity at low prices. It is forced with but little trouble and would pay well if grown for the market.

Sweet peas are selling well here, George Cartwright has a bench of Blanche Ferry 160 feet long and eight feet high from which he is cutting a large quantity but they all go.

Unless there should be extensive backing-out between now and next August Boston will send the biggest delegation on record to the Atlantic City meeting of the S. A. F.

Washington.

Trade has been fair in the cut flower line during the last week, while the plant trade has been unusually good for so early in the season. The market florists report trade excellent since Easter, and prices have kept up above that of former years. Trade in plants bids fair to exceed former years and the boys must have had an inkling to that effect, as the majority have made ample preparations to meet the demands.

Roses are exceptionally good and in profusion. Clark Bros. are cutting the finest La France that have come to our market in years. The rose houses of Gude Bros. at Anacostia, D. C., are a pleasure to behold. Their stock is fine and healthy, and a mass of buds; these houses which have only been erected about nine months have yielded a wonderful quantity of fine bloom during the entire winter. They are cutting thousands of most perfect buds daily. Their La France, Perles, Meteors, Brides, and Beauties are worth a drive to see.

Strauss & Co. are producing some of the finest Kaiserins ever put upon this market. They seem to have struck the key-note in the cultivation of this excellent rose, as they did with the Wootton, for I

have never seen either do as well in any other establishment. Its keeping qualities are ahead of most any others. Their houses are like a field of bloom. They are also cutting excellent sweet peas, in great quantity. They made a happy strike with this popular flower this season by having them unusually early.

Carnations are scarce and poor. Other flowers are plentiful.

At the funeral of Hon. J. Z. Vance, the late senior senator from N. C., which took place in the senate chamber last Monday there was entire new departure in the decorations of the chamber. The old employees, some of whom have been in the employ of the Senate for thirty years or more, say they never saw the chamber so profusely decorated with plants. In the alcove at the back of the Vice-President was a fine specimen of Areca lutescens. In either corner of the chamber to the right and left of the Vice-President was a large group of palms reaching from the floor to the galleries. Palms, rubbers and pandanus were arranged all around the chamber in niches formed by the columns to support the galleries. This was the work of Strauss & Co. To the right of the Vice-President stood a fine specimen of Araucaria Mulleri, while to his left was a fine Araucaria Cookii. Each of these plants were about 12 feet high; they added both grace and richness to the entire decorations. The araucarias were from the Botanic Garden. I am inclined to think that this new departure will be used as a precedent and that for all funerals from the Senate hereafter the chamber will be similarly decorated.

At the head, foot, and either side of the casket were arranged eight specimen araucarias, as they were the nearest things to be had to represent the deceased's native state. This was done at the request of the family. There was a scarcity of set pieces. On the casket, which was placed in the space immediately in front of the Vice-President's seat, was a very large and handsome wreath of Bride roses, tied with wide purple ribbon; resting carelessly on this was a bunch of Beauties loosely tied, and a basket of mixed flowers from the Vice-President. A pair of sago palm leaves forming a cross, another pair of sago leaves forming a St. Andrew's cross, had resting upon them a handsome bunch composed of cattleyas, vandas and asparagus, which looked very rich upon the fine cloth covering of the casket; this was from the Joint Committee on Library. A bunch of Harrisii tied with ribbon, and a bunch of callas, constituted the floral offerings with the exception of a broken column about 5 feet high composed of galax leaves. This rested on a base about 3 feet square which was filled with adiantum studded with fine Kaiserin and Mermet roses. Encircling this column about ⅔ the way up was a handsome wreath of Kaiserins and La France buds tied with a bow of broad pink ribbon. This was ordered by the Senate and was placed at the left of the Vice-President on the desk of the Secretary. It was a most excellent and artistic piece of work, arranged by Mr. Wm. Crawford, of C. Strauss & Co. REYNOLDS.

St. Louis.

The early part of the past week has been marked by the worst glut of the season, good stock even being hard to dispose of. It only lasted for a few days however, and the market at the end of the week was much easier.

Spring appears to have come to stay and planting out has commenced again. This is particularly true of the cemeteries, where considerable work is being done.

It is with extreme sadness that we learn of the death of our esteemed fellow craftsman, Mr. Myron A. Hunt, and expressions of condolence and sympathy are heard on all sides upon the announcement being made. R. F. T.

Buffalo.

The event of the week just passed which has overshadowed all others, was the opening of Joseph H. Rebstock's new store on Main street. No money or pains has been spared to make this store a most complete and elegant affair in all respects. Some of the leading features which your correspondent noticed on his visit during the first day of the "opening" were as follows (But if the proprietor thinks I have got some of it wrong, it is his own fault, for what with bewitching music, lovely ladies and other "sparkling" attractions, it was hard to keep one's reason, much less memory): Down the center of the store was a row of medium sized palms, which led the visitors down one side to the conservatory in rear of the store. The conservatory was very gay with everything of the season. Round the entire wall was a row of well grown longiflorum lilies, but raised up 7 or 8 feet. The benches were filled with flowering plants, hyacinths, boxes of tulips, hydrangeas, heaths, cytisus, roses in pots, etc. In the center was a group of tall specimen palms bordered by smaller but choice plants. The center plants were cycas, dracænas, pandanus, latanias, standard bays, Araucaria excelsa and others several of them 10 feet high. Following the procession and returning through the store you passed the office, from which issued the aforesaid music. In every nook and corner were magnificent vases of flowers of every sort in season. Of course roses were most prominent. A good deal of laurel and asparagus was used to festoon here and there but it was not over done in that respect. There are mirrors on all sides, bottom, top and sides. The front window, which is a grand size, was for the occasion simply but most effectively arranged. It was occupied by 200 good plants of Adiantum cunatum, in the center of which was a bowl of American Beauties four or five feet across. Thousands visited the store during the two days and everyone received a flower according to his or her desire. On asking Joe how he was pleased he said he never did such a *business* and never saw so little cash; as he insisted on selling nothing for two days he could not expect a different result. At a certain hour there happened to meet a dozen or so of the craft and after a good survey of the fine store they felt so low spirited that they rushed in a body to drown their misery in a game of bowls and its concomitants.

We don't have fakirs yet on the street and I hope never will, but we have spring flowers with us and they are selling them on the market at such a price that it will knock the bottom out of that sort of business in the stores. Flowers of all kinds are very plentiful.

Business must be called rather quiet for this season. Not as many large society events as there should be. There is talk now of getting the florist bowling team together. St. Louis was the first convention at which Buffalo was not represented by a bowling team. It surely can raise one for Atlantic City. There is great young blood here now, and they pile up wonderful scores, but you know how unreliable these colts are when they get before a crowd. We should most likely depend on the old veterans whose stiff joints readily yield to lubrication and the exhilerating company of other vets.

W. S.

Toronto.

Roses are cheaper now than ever before in this city and the fine weather has brought them out in great quantities. They sell well at the prices obtained but it is pretty safe to say that the consumer is getting the best of the bargain just now.

The Gardeners and Florists' Association held its regular monthly meeting on Tuesday last, which was exceptionally well attended for this time of year when everyone is busy preparing for the spring rush. The meeting was considerably enlivened by discussions and explanations concerning judges and judging at former and future shows, Mr. F. G. Foster of Hamilton having come up on purpose to take part.

A paper entitled "Pruning Ornamental Shrubs" was read by Mr. Geo. Vair, which elicited many commendatory remarks and much discussion. The citizens of Toronto sadly need education on this subject, and Mr. Vair said that his paper might as well have been called "How to leave ornamental shrubs alone." Mr. Vair's essay was gotten up at very short notice and a great deal of it was not written, so that I regret that the copy which was handed to the secretary is hardly in a fit state for publication, but I hope to get Mr. Vair to revise it shortly. I however enclose a few remarks on the subject [See another page.—ED.] written by a member who was unable to be present, which probably may be applicable to other cities as well as this. Both Mr. Vair and Mr. Foster said that the ornamental shrubs in Washington, especially at the Smithsonian Institute, were treated better than they had seen anywhere else.

E.

Ottawa, Canada.

Trade for the last two weeks has been exceptionally good for this season of the year, and the supply of roses and other flowers, carnations and violets excepted, has been equal to the demand. There has been a great demand for violets here this season. Sessional "dinners and dances ye know" have been numerous, and the beautiful spring weather has helped the buttonhole and corsage trade considerable. We escaped the blizzard that Toronto and other towns have been favored with; although we are far north we are seldom treated to hurricanes or extreme drouth. Last season we had abundance of rain while most places were suffering. As we have more electricity, both light and power, than most places of the size that may have something to do with the rain.

Harry Parks has purchased some lots in the center of town and has started to build. He gives up his present houses in the fall.

C. Scrim has been having quite a hunt for a dead rat lately. Shelves, drawers and boxes were turned out, and the refrigerator, where the smell was intense, was examined, ice chamber and all; but the rat could not be found till a lady popped her nose into a box of allium. He has cancelled his order for allium bulbs. Once is enough.

The crop of bulb drummers has been larger than usual this season; they all have the best of course. ZERO.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

SITUATION WANTED—In or around greenhouses, by young man, 26; 8 years' experience; references. THOS. RODHAM, Scranton, Pa.

SITUATION WANTED—By young man of 2 years, experience as florist; references. Address NELS PETERSON, 79 S. Jefferson St., Chicago.

SITUATION WANTED—By gardener, single; experienced in commercial or private place; sober, willing; good references. J. N., Red Bank, N. J.

SITUATION WANTED—By experienced rose, carnation and chrysanthemum grower; single; best of reference. FLORIST, Fort Shilacoom, Wash.

SITUATION WANTED—By gardener and florist; cut flowers, graperies, vegetables and mushrooms; commercial or private; age 32, married. E, care American Florist, Chicago.

SITUATION WANTED—By first-class florist with life experience; age 32; able to take full charge of commercial or private place. Address N M, care American Florist, Chicago.

SITUATION WANTED—As foreman for commercial place; well up in roses and general plants; 18 years' experience; can handle men; good references. Address W S, care American Florist.

SITUATION WANTED—As foreman, manager or head gardener in private place; 20 years' experience; married; good references. Address LAKE GENEVA FLORAL CO., Lake Geneva, Wis.

SITUATION WANTED—By a young man; is German, single; would like a job in greenhouses in city; good references of two florists, the last in city. Address F O, care American Florist, Chicago,

SITUATION WANTED—By gardener, commercial or private; 12 years' experience, steady, sober; willing to do anything wished done; age 25; Protestant, English, FISHER, box 178, Kenosha, Wis.

SITUATION WANTED—By first-class designer, also willing to make himself useful in greenhouse if necessary; single man of 30; first-class references. Will work for moderate salary if steady place. Address C W, care American Florist.

SITUATION WANTED—By a first-class florist, single German, with 15 years' experience, good propagator and cut flower grower; also good design worker, as foreman on commercial or private place. Can give good references. Address K. C., 1206 Vine St., Cincinnati, O.

SITUATION WANTED—As manager or foreman; thoroughly versed in growing cut flowers and plants; has lived in some of the leading places in England and this country; over 20 years' experience; good references. When applying give particulars. FLORIST, 129 N. Clark St., Chicago.

SITUATION WANTED—By a practical Scandinavian, 18 years' experience, married, as a working fireman or gardener in commercial or private place; thoroughly understands all branches of the trade; highest references; state wages; west preferred. Address PRACTICAL, care American Florist.

SITUATION WANTED—By nurseryman's son, English, with life experience; formerly with B. S. Williams, London; married, one child; roses and carnations my specialty. Have had five years' experience at steam and hot water engineering. Would undertake any size place or go shares and build up a plant. Address SPECIALIST, care Am. Florist.

WANTED—Hardy ground myrtle, about 10 barrels; state price per barrel. GUS KNOCH, Woodmere, Mich.

WANTED—Wm. R. Conover's address, lately at Mendenhall's, Minneapolis; supposed to be in Chicago. FITZSIMMONS, Lansing, Mich.

WANTED—An outside gardener, one who understands both outside and inside work; middle age, sober and industrious. MRS. A. SCUFF, Menominee, Mich.

WANTED—To purchase florist establishment adapted to cut flower growing for the market; a location in eastern New England preferred. Address A, care Eastern Office American Florist, 67 Bromfield St., Boston.

WANTED—Florist, experienced in growing cut flowers (roses in particular) and forcing of bulbous stock; state wages expected, with references, whether married or single. Address WM. HALBROOKS, 924 E. Oregon St., Evansville, Ind.

WANTED—A competent florist to take entire charge of a small commercial place 20 miles from St. Paul; must be a good designer and a good all around man. Good wages and a permanent place to the right man. FRANK BERRY, Stillwater, Minnesota.

WANTED—In a well established florists' business an active partner with capital of $3,000-$5,000. An immense extent of country with rapidly increasing population and very little competition. No such chance on the continent. Address A. BOWERMAN, box 956, Winnipeg, Manitoba.

WANTED—A PARTNER—To join me growing and selling native and foreign hardy ornamentals, to meet the wants of American and foreign customers. Trade already well established and growing. A Christian and a prohibitionist preferred. Must be competent for the business, and free from bad habits. Some capital needed. Guaranteed a first-class opening for the right man. WILFRED A. BROTHERTON, Rochester, Mich.

REMOVAL NOTICE.

This is to inform our friends and patrons that on and after May 1st, '94, we will be located at

At a bargain, the best retail florist place (1 store and greenhouses) in the city and doing a good business; poor health reason for selling. For further particulars address H. F. HALLE, 548 W. Madison St., Chicago.

ROSE GROWER WANTED

WANTED—A thoroughly competent man to take a position as foreman in a first-class establishment within a few hundred miles of Chicago. Must be a man who can grow roses and carnations of the very best quality. Must be temperate, thoroughly experienced and reliable. The best of references required from reliable growers. This will be a good and permanent position to a good man. Any such who would make a change within the next few months will do well to correspond with us. Address

"LA FRANCE," care Am. Florist.

Splendid Business Opportunity

The widow of the late Robert J. Purvis, being unable to continue the business, will sell at a low price the stock of 35,000 plants, tools, etc., used in the business of her late husband. Everything in first-class condition. The six greenhouses can be leased for a term of years at a low rate. A splendid opportunity for an energetic young man with some capital. Address

MRS. R. J. PURVIS,
EDGEWATER, CHICAGO, ILL.

A RARE CHANCE FOR INVESTMENT

FOR SALE.

Columbia Farm, containing over 20 acres arable and grazing land, climate one of the finest in the world. Frost and malaria unknown. Lilies, narcissus and amaryllis grown in open ground throughout the winter. Enough Harrisii and other Bulbs will be furnished to stock the farm, so that new proprietor can enter at once into business, which should be started not later than August next. Our Harrisii Bulbs have a world wide reputation, and a good practical manager can secure handsome profits. Sold because other business claims my attention. Communicate with

Address THE AMERICAN FLORIST CO., Chicago.

THE HAMPDEN COUNTY (Mass.) Horticultural Society issues an attractive annual, of which we recently received a copy. It contains premium lists of their shows, to be held during the current year, and other matters of interest.

A DOZEN WOOTTON roses from C. R. Gallup, Denver, Colo., were recently sent us as a sample of what can be done with this rose in Colorado. They were very large and deeply colored flowers, and the wood was as stout as that of the Beauty; they reflected great credit on the grower.

REPLYING to "A Reader," the proper place for the thermometer in a greenhouse is on a level with the eyes when standing. It is true that the temperature may vary in different positions in the same house but the temperatures mentioned in cultural notes by correspondents in the FLORIST are taken from thermometers that are hung at a height of from five to six feet from the ground. Any other position would be so unusual that probably none thought it necessary to specify the height at which they hung their thermometers.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer, 114 Chambers street, New York. Next annual meeting second Tuesday in June, at Toronto, Ont.

As a Seed Grower Sees It.

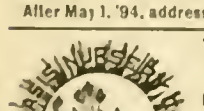
The present way in which a large lot of the seed business is done is so very expensive, rent, help, catalogues, advertising, etc., the cost of the seed is but a small item.

The income lasts 90 to 100 days, the balance of the year is outgo. In the great desire to over-reach one another there is considerable cutting in prices. The result is the expensive way in which the business is done, prices are too low and not enough made. The next step is to cut down all expenses to the finest edge and squeeze the life blood out of every one concerned, including the cost of seeds—the vital part.

The question is, will the growers be cut to death, or maintain fair living prices and compel the dealers to adopt better and more business-like methods, keep prices up to a living figure and stocks up to standard? *No one profits by low priced seeds.* Which course is best for the million? Too much European in the present style, I say.

AN OLD AMERICAN SEED GROWER.

W. ATLEE BURPEE is on a trip to California, via Florida and New Orleans; he will return in time for the seedsmen's annual convention at Toronto in June.



A SECOND EDITION of Spraying Crops, by Prof. C. M. Weed of the New Hampshire Agricultural College, has just been issued. It treats of both fungicides and insecticides, and the best methods of combatting both. (Orange Judd Co., New York).

THE West Virginia Horticultural Society was organized at a meeting of horticulturists at Morgantown, W. Va., April 5. Officers were elected as follows: Adolph Hiehle, the florist of Parkersburg, Pres.; J. W. Garvin, Wheeling, Vice-Pres.; Prof. F. W. M. Rane, of the Experiment Station, Sec'y and Treas. Over 20 members were enrolled, representing several counties. Mr. Hiehle read a paper on floriculture and means of increasing the interest in horticulture in the state. A constitution was adopted.

Sole Agents for U. S. for Chas. Macintosh & Co., England, Inventors of Vulcanized India Rubber. Extra strong greenhouse hose to withstand high pressure. ¾-in., 3-ply, 15c. per foot in 60 feet lengths.

Cincinnati.

The regular monthly meeting of the Cincinnati Florists Society was held at the society's rooms in the Floral Market, Prest. Critchell presiding. Minutes of last meeting read and approved; three new members were added to the ranks. The advisability of holding a floral exhibition and chrysanthemum show was discussed at length, and finally tabled, with the decision that Cincinnati should have a show in 1895.

The florists all seemed to be having a nice trade in the market Saturday night, the flower market being crowded. It is certainly a grand sight to stand on the stairs leading to the society's rooms, and see the display as it shows up in said market. Every visitor has the same remark. "It is grand, the florists of Cincinnati surely ought to be happy."

Mr. N. Ohmer was a visitor with us Saturday. Mr. Ohmer is one of the foremost horticulturists in Ohio, having introduced many new varieties of fruits, including the Gregg raspberry and the Ohmer blackberry. He has now retired from active business, being seventy-one years old, but with more vitality than half the young men, he with his wife has just returned from a trip to the midwinter fair in California. He says the exhibition is a grand one but should not be compared for a moment with the late World's Fair.

Our flower stores are all quite busy this week with various decorations. Julius Baer helped to celebrate a golden wedding Monday by furnishing a large number of Perle roses for same. Chas. J. Jones, Jr., of East Walnut Hill has a very large wedding decoration for Wednesday, including church and house. Mr. Jones is building a combination store and greenhouse for the sale of cut flowers, palms, etc.

H. L. Sunderbruch has branched out as a grower, and is now running the McFadden plant, formerly managed by the late John Rose.

L. H. Kyrk & Co., who started in business last fall, are doing a nice business, and we trust making money, Lou as well as his sister being well known to the trade, and popular.

Mr. Albert McCullough is spending a few weeks at Hot Springs, Va., taking a much needed rest.

From general appearances the florists will have a good trade on Decoration Day, as nearly all the outdoor flowers were killed by frost several weeks ago. Seed trade very good. E. G. GILLETT.

New Catalogue (No. 4) containing over 1,000 Ornamental Cuts for Florist's use, such as envelopes, letter heads, bill-heads, cards, advers., floral designs, etc., at from 30c. and upwards. Price of Catalogue 25 cts. (deducted from $1 order).

H. WATERER,
109 South 7th St., Philadelphia, Penna.

Germantown, Pa.

The first spring exhibition of the Germantown Horticultural Society was held in the hall of the Young Men's Christian Association, Main and Price streets, on Wednesday, April 4. This show was the first held under the new plan proposed by Mr. Joseph Meehan and adopted last winter; namely, to hold two large shows yearly; a spring show at Easter and a chrysanthemum show in the fall, and to give up the small monthly exhibitions. Unfortunately, the committee in charge, while carrying out the letter of this plan, were not willing to risk carrying out its spirit. They decided not to put the society under any expense but to save all funds possible for next fall. Hence instead of the usual cash premiums or medals, certificates of merit were offered as prizes. This fact, together with the date of the show, which was fixed for ten days after, instead of two weeks before Easter, was largely responsible for the lack of exhibits and the meagre attendance; gardeners are not a mercenary lot; they will do much for love of their calling, but they cannot be expected to leave their work just in the middle of the spring rush to exhibit plants and flowers which represent much time and money, without the least return. Still the show cannot be called a failure. A lot of fine flowering and decorative plants were shown. To Mr. Albert Woltemate, who is the most public spirited florist in Germantown, the society is indebted for a fine collection of palms and azaleas. The other exhibitors were Messrs. Henry Diehl, who showed some fine hydrangeas, Matthew Broeken, Michael Sammon, Morrison and Holmes.

Now that Easter is a thing of the past a few notes may be of interest. Besides the regular stores, several new ones were opened by enterprising growers to dispose of their stock, and these, with the curbstone venders and hucksters, made our streets look unusually bright and pretty. Quite a number of lilies and a few other blooming plants were left unsold on Saturday night but all cut flowers were cleared up and such a large number of plants that the growers generally were well satisfied. Easter, 1894, showed an improvement on its predecessors, thanks largely to the fine weather.

Mr. Walter R. Cliffe has left his father's place and formed a partnership with a capitalist in West Philadelphia. The new firm expect to erect eight houses at once and will grow roses, carnations and other cut flowers for the wholesale market. Mr. Cliffe has done so well in the past that his friends can only wish him equal success in the future.

A rather amusing incident occurred in West Philadelphia last week. Mr. J. W. Colflesh was visited at the same time by representatives of Messrs. Pierson, Vaughan and Ely, all anxious to secure his orders. This was rather embarrassing. Mr. Colflesh didn't want to split his order and left it to his visitors to settle the matter. The genial Mr. Burt Eddy, representing Mr. Vaughan, proposed deciding by straws; the man getting the longest straw to stay and talk to the customer. Curiously enough, the lots fell in the order in which the travelers had arrived. Mr. Pierson's man drew the long straw and remained, while Mr. Eddy, and Mr. Reed of Ely's, who were second and third comers respectively, sought new fields of labor. J. W. Y.

Pansies in bloom.

First-class plants from cold frames. Send $2.00 for sample hundred.

W. J. ENGLE, Box 211, Dayton, Ohio.

St. Paul, Minn.

The fore part of the week trade was brisk but the latter part except for funeral work, proved dull and uneventful. On Monday night, April 9th, occurred *the* society event of the season, the Elks' Benefit at the Metropolitan opera house, and flowers were in great demand. The decorations were among the finest ever seen in the city. Green wreathing hung in festoons from the balcony and gallery railings, depended from the boxes and entwined the pillars. Groups of palms, lilies, and hydrangeas flanked the front of the stage on either side, while tall Harrisii in full bloom nodded from the boxes and intensified the beauty of the scene. In the lobby were groups of palms and flowering plants appropriately placed, while the landings on the balcony stairs were embellished in like manner. The finest floral attraction of the evening however was the Elk's Head, the emblem of the order, placed in a conspicuous position at the entrance. This was most satisfactorily constructed by Mrs. Garges, and with its rich and striking colors, contrasting finely with their surroundings, and its faithful portrayal of nature, caught and riveted the attention of all. The antlers were made of red carnations, the head and ears of white ones, while the mouth, eyes and nostrils were delineated in red. The neck consisted of white roses, carnations and small flowers so arranged as to give the wrinkled effect seen in the noble animal in life. A background of green gave a proper setting to the whole and almost imbued it with life.

During the play "An Unequal Match," presented by Miss Marie Wainwright and company, the beauty of each scene was enhanced and emphasized by different arrangements of plants and flowers, in beds and vases. At the close of the first act Miss Wainwright was presented with a bouquet of five dozen Am. Beauties tastefully arranged and tied with ribbon. Each actress was also presented during the evening with a bunch of two dozen roses tied with ribbon. The majority of the audience, which was composed of the clite, were in full evening dress and beauty, flowers and gaiety were seen in profusion on every hand. The decorations were made under the personal supervision of L. L. May. The arrangement of the plants and flowers on the stage for the different acts was very artistically performed by Joseph Taylor of the same firm and assistants.

The latter part of the week has been damp and cloudy and everything has worn a mournful appearance in contrast with the brightness and gaiety of the fore part. Stock however is looking well, despite the absence of sunshine.

Prices of cut flowers remain firm with a good supply on hand. Violets are nearly gone though we notice Chris Hansen is still cutting some fine ones. Beauties are now the finest of the season with a brisk demand for them. They retail readily at $3 per doz. Some Harrisii are still seen but the demand for them is light.

Quite a number of Holland drummers have appeared and report good sales except in tulips.

There is a brisk demand for potted plants in bloom and anything with a flower sells readily.

Our genial Alderman Warren, proprietor of Warrendale greenhouses, was defeated for renominntion to the city council, but Brother Warren takes his defeat with his usual *sang froid* and murmurs "after all it might not have been."

FELIX.

CANNA Florence Vaughan, Per 100 $25.00.

"Before I had them a week I secured a $75 order directly through showing them."

☞Priced Catalogues are gratis on application to

DAN'L B. LONG, *Publisher,* **Buffalo, N. Y.,**

Fenster Pappe, **A Substitute for Glass.** Stretch FENSTER PAPPE taut and use batten in nailing on to sash. Then paint the rough surface thoroughly with boiled linseed oil until it shows a gloss. Let it become THOROUGHLY DRY before using, when it is claimed to do service for years. The application of the oil makes FENSTER PAPPE sufficiently translucent for plant life.

IT IS USED as a covering for cold pit sash; excellent for use in palm or fern houses; to grow strawberry plants, early vegetables, tobacco, etc., under. A most handy article as a protection against the direct rays of the sun.

TRY a roll of eight yards as a sample, which will cover about four sash, for $1.00. Original rolls, 36 inches wide, 110 yards long, for $9.00. For further particulars address

Montreal.

We are enjoying remarkably fine weather here just now, in fact it is like summer; we have not had a drop of rain for over six weeks.

The retail florists all complain of poor business, flowers of all kinds being abundant. There are quite a few Harrisii lilies and spirea to be seen in the windows yet, for which there is little demand.

Mr. Harry Stocking, the popular ex-secretary of the G. and F. Club, has been laid up with a severe attack of scarlet fever, but is now convalescent.

Mr. John Kirkwood, the gardener at R. B. Angers' place for a number of years, has left there, and his place has been filled by Mr. W. Wilshire, late gardener to Sir John Abbott. The latter place, owing to the death of the proprietor, is being sold out. I hear the contents of the conservatories and greenhouses, including one of the choicest collections of orchids in the country, is to be sold at auction in the near future. BEAVER.

San Francisco.
